Disclaimer

The contents of the book serve to provide both general and scientific information about medicinal plants and their uses and are not intended as a guide to self-medication by consumers or to treatment by health care professionals. The general public is advised to discuss the information contained herein with a physician, pharmacist, nurse or other authorised health care professionals. Neither the authors nor the publisher can be held responsible for the accuracy of the information itself or the consequences from the use or misuse of the information in this book.

The resources are not vetted and it is the reader’s responsibility to ensure the accuracy of the information cited. Readers are reminded that the information presented is subject to change as research is on-going and there may be interindividual variations. While every effort is made to minimise errors, there may be inadvertent omissions or human errors in compiling these monographs.
This book is dedicated to our families for their support 
and to our students who continue to inspire us!
Foreword

At first glance, “A Guide to Medicinal Plants: An Illustrated, Scientific and Medicinal Approach” appears to be a medical compendium of plants intended as a guide and reference resource for professionals in the field. To my delight and I am sure of anyone who picks up this book, I discovered it contains nuggets of information that would interest a great many readers, from schoolchildren to teachers, from undergraduates to researchers, from homemakers to business people and of course, the healthcare professionals.

It is an authoritative and well-researched work on seventy-five, mostly familiar plants that have medicinal value. These grow well here and in the tropics. Although there have been books on medicinal plants published locally, none can match this comprehensive work which, as the authors state, is the first of its kind.

It contains information in well laid-out sections that would interest the healthcare professionals and at the same time, provide the general public valuable insights into the traditional use of plants as medicines. Today such plants are being studied intensively to elucidate their bioactive composition in the hope of discovering novel therapeutics and potential cures for major diseases such as cancer and AIDS.

This guidebook is user friendly. It provides the reader the ability to identify the seventy-five plants through their scientific, vernacular and common names as well as through the descriptions and high quality photographs. Readers are also free to go straight to the section that interests them most. A strength of this book is the detailed references provided for each plant and these are provided towards the end of the book for the serious reader or researcher.

One word of caution that the authors themselves have provided in the text but is worth repeating. Do not mistake this scientific book for a do-it-yourself medication guide. As the authors aptly state, “the information collated is not meant to be a guide for self medication by consumers or for treatment by healthcare professionals.”

I commend the authors for this labour of love and have no doubt that this book will be much sought after by both the healthcare professionals and the lay public.

Professor Leo Tan Wee-Hin
President
Singapore National Academy of Science
Preface

“All things are poison and nothing is without poison, only the dose permits something not to be poisonous” i.e., “the dose makes the poison”.

Paracelsus

This book presents up-to-date information on a total of 75 medicinal plants. It is a single, comprehensive yet easy to read book on various important information on medicinal plants for both the general public and health professionals (clinicians, pharmacists, nurses and Complementary and Alternative Medicine practitioners).

This is the first publication of its kind on medicinal plants growing in Singapore. Information collated includes plant description, origin of the plants, traditional medicinal uses, phytoconstituents, pharmacological activities, adverse reactions and reported drug-herb interactions. In this era of evidence-based medicine, scientists are increasingly looking towards the traditional uses of medicinal plants for clues to the discovery of potential lead compounds and novel therapeutics.

With the growing interest in drug discovery, this book is useful and timely as many of the plants found growing in Singapore are still understudied. Besides native medicinal plants, some of the plants featured in this book also include those that originated from other parts of the world. It will appeal to both local and overseas readers. Colourful photographs of each plant are also included for ease of reference and aesthetic appeal. There is no minimum level of knowledge required to read this book yet it is useful for academics, scientists and professionals as it provides a comprehensive reference list at the end of the book. This book will also appeal to working professionals, clinicians, pharmacists, nurses, educators and researchers. It serves as a quick reference to the medicinal uses and properties of medicinal plants. Educators and students in complementary medicine and health, pharmacognosy, medicinal chemistry, natural products, pharmacology, toxicology, pharmacovigilance, medicine, pharmacy, nursing, botany, biology, chemistry and life sciences
will find the information useful. Greater understanding of such plants will enhance their appreciation of nature and their various fields of study.

The authors hope that this book will inspire and stimulate further research and greater interest in nature, biodiversity, bioconservation, drug discovery and our natural resources, the medicinal plants.
Guide to Using This Book

This book is intended for both the general public as well as health professionals. Hence, it is quite a challenge to present the vast amount of information collated from published literature over the years, in a simple way that will benefit and interest different groups of readers. In general, the information presented is fully referenced. Wherever possible, the original terms in the references are used. Difficult botanical and medical terms are explained in simple terms in the glossaries provided.

Monographs of the plants are arranged in alphabetical order of the Latin binomial name. Each monograph consists of information which includes the scientific name with the family name in parenthesis, common name(s), coloured photographs, description, origin, phytoconstituents, traditional medicinal uses, pharmacological activities, dosage (if available), adverse reactions, toxicity and reported drug-herb interactions. Authors’ notes are added in some cases as well. Cross listings of the scientific names and common names, and vice versa, are provided in the appendix for easy reference.

Traditional medicinal uses refer to those uses that have been reported and may not have been studied scientifically. Pharmacological activities refer to the biological activities that have been reported in scientific publications involving mainly in vitro or in vivo tests using animals, and very rarely, in clinical trials. Activities due to extracts as well as pure components are reported. Due to space constraints, only the keywords are given. Interested readers can refer to the original publications for more details. The full list of references is provided at the end of the book according to the plant names in alphabetical order.

“No information as yet” means that no such information is available, the authors have not found the relevant information, or the information found is not cited due to lack of clarity or completeness. A word of caution: although some dosages have been reported and cited, these have largely not been verified in clinical trials. For phytoconstituents, it is not possible to list down all reported constituents. Hence only selected constituents, especially those peculiar to the plant are shown, typically with the most important ones listed first. Interested readers can refer to the references cited for further details.
Although medicinal plants are generally safe when used appropriately according to the traditional methods, some are inherently toxic. In addition, inappropriate use (wrong plant parts, dose, frequency, route of administration, preparation, etc.) or abuse may lead to undesirable consequences. The information collated is not meant to be a guide for self medication by consumers or for treatment by health care professionals. There is a fine line between a poison and a useful drug afterall.
Acknowledgement

The authors would like to express our heartfelt gratitude to:

Professor Wee Yeow Chin for his professional advice and constructive criticisms

Professor Ben-Erik van Wyk, Professor Zhao Zhong Zhen and Professor Hugh Tan for their professional advice

Staff and students who have contributed to this book

The National University of Singapore for financial support of an Academic Research Fund (R-148-000-079-112)

Staff of Nparks (Singapore) and Singapore Botanic Gardens, especially Professor Benito Tan, Mr Lua Hock Keong, Ms Serena Lee, Ms Patricia Yap and the park rangers

Staff of Singapore Science Centre

Many like-minded friends and colleagues for their interesting and inspiring discussions on medicinal plants

Staff of World Scientific Publishing for their professionalism and support

Plant Monographs
1. **Abrus precatorius** L. (Leguminosae)

Rosary Pea, Indian Licorice, Precatory Bean

**Description:** *Abrus precatorius* L. is a perennial climber with a slender stem. Leaves are pinnate and 5–8 cm long. Leaflets are rhomboid, numbering 20–24 or more, opposite and are 1.2–1.8 cm long. Leaf margin is entire. It bears pink flowers arranged in dense axillary racemes. Pods are oblong, cylindrical, inflated, 5–6 cm by 1 cm and contains 3–6 round, glossy, black and red seeds.[1–3]

**Origin:** Native to Pakistan, India, Ceylon and tropical Africa; and introduced widely in the New and Old World.[4]

**Phytoconstituents:** Abrectorin, abricin, abridin, abrins A–D, (+)-abrine, abruslactone A, abrusgenic acid, abrusogenin, abrusoside A–D, precatorine, abruquinones, abraline, abrusic acid, abruquinone G and others.[5–18]

**Traditional Medicinal Uses:** A decoction of the leaves has been prescribed for scurvy, cough, bronchitis, sprue and hepatitis and as a refrigerant. They are also
applied on painful swellings, eye inflammation, cancer, syphilis and on leucodermic spots.[19] The leaves are also effective in the treatment of coryza, cough, fever, and jaundice resulting from viral hepatitis and intoxications.[6] The seeds have been used to treat fever, malaria, headache, dropsy and to expel worms.[3] A decoction of the seeds is applied for abdominal complaints, conjunctivitis, trachoma and malarial fever.[2] Central Africans use powdered seed as an oral contraceptive.[5] It is also used to lower high blood pressure and relieve severe headache.[5] The seeds are very toxic and can be applied externally to treat bacterial infection and accelerate the bursting of boils and to cure mastitis and galactophoritis.[6] The seed has purgative properties and is used as an emetic, tonic, aphrodisiac, and for nervous disorders. The poultice can be used as suppository, abortifacient, or tonic for pregnant women and children and to treat severe headaches.[19] Water from the boiled roots is used to cure cough, bronchitis, sore throat and also applied as an emetic agent.[2,5]

**Dosage:** In Central Africa, 200 mg powdered seeds are used as an oral contraceptive which can last 13 menstrual cycles.[5] Approximately 14 g of powdered seeds are used as tonic for pregnant women and children.[19] About 5–7 of seed grains are prescribed for pertussis.[37]

**Adverse Reactions:** Ingestion of Abrus seeds resulted in pulmonary oedema and hypertension.[38] Abrine can cause coma, confusion, convulsions, dehydration, gastroenterosis and hypotension.[37]

**Toxicity:** The LD₅₀ of abrin in mice is 0.02 mg/kg body weight.[2] Ingestion of seeds causes severe stomach cramping accompanied by nausea, severe diarrhoea, cold sweat, fast pulse, organ failure, coma and circulatory collapse.[5] Oral administration of a 50% ethanol extract of A. precatorius seeds (250 mg/kg) in albino rats for 30 and 60 days induced infertility in males which was reversible.[40] Dose-dependent degenerative changes in the testicular weights, sperm count, spermatogenesis and Leydig cells were observed in testes of rats treated with steroidal fraction of the seeds.[41] The methanol extract of the seeds caused a concentration-related impairment of percentage human sperm motility with an EC₅₀ of 2.29 mg/ml.[42]

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
2. **Adiantum capillus-veneris** L. (Polypodiaceae)

Black Maidenhair Fern, Southern Maidenhair Fern, Venus Hair Fern

*Description:* Adiantum capillus-veneris L. is a perennial fern with short creeping stems. Leaf blades are lanceolate, pinnate, 10–45 cm by 4–15 cm and glabrous. Ultimate segments are various but generally cuneate or fan-shaped to irregularly rhombic, about as long as well as broad with its base broadly to narrowly cuneate. Plant is delicate, brittle and has dark stalks.[1–6]

*Origin:* Native to America, Mexico, West Indies and South America. It can also be found in temperate regions of Eurasia and Africa.[6]

*Phytoconstituents:* Adiantoxide, adiantone, isoadiantone, isoadiantol, hydroxyadiantone, capesterol and others.[1,4,7–11]
Traditional Medicinal Uses: The fern is considered an astringent, demulcent, depurative, diaphoretic, diuretic, emmenagogue, emollient, expectorant, laxative, stimulant, sudorific and a tonic.\[1\] It is also used for alopecia, asthma, bladder ailments, catarrh, chest ailments, chills, cold, dropsy, dysmenorrhoeal, fever, head ailments, hepatitis, labour, lung ailments, respiratory problems, rheumatism, sclerosis, snake bite, sores, sore throat, splenosis, stones and other urinary calcification.\[1,4\] The plant expels worm, induces vomiting and relieves fever. Used externally, it is poulticed on snakebites and as a treatment for impetigo.\[1,3\] The Russians use the herb for rhinitis while the French, with orange flowers and honey, uses it for pulmonary catarrh.\[1\] A handful of leaves is made into a tea and drunk as an expectorant, astringent, tonic for coughs, throat afflictions and bronchitis.\[1\] The plant is also used as a hair wash for dandruff and to promote hair growth in Latin America.\[1,3\] The ashes mixed with vinegar and olive oil is rubbed into the scalp to cure alopecia.\[5\] In Traditional Chinese Medicine, the leaves are used for bronchial diseases and as an expectorant;\[3\] and in Africa, the leaves are smoked to prevent head and chest colds.\[1\]

Pharmacological Activities: Antibacterial.\[12\]

Dosage: Taken internally as a tea prepared from powdered dried fronds. The standard single dose is 1.5 g of drug to 1 cup of fluid per dose.\[13\]

Adverse Reactions: No known side effects with therapeutic dosages.\[13\]

Toxicity: No information as yet.

Contraindications: Should not be used during pregnancy.\[13\]

Drug-Herb Interactions: No information as yet.
3. **Allamanda cathartica** L. (Apocynaceae)

*Allamanda, Common Allamanda, Golden Trumpet*

**Description:** Allamanda cathartica L. is a woody shrub that can grow up to 4 m tall. The stems exude milky white sap when incised. Leaves are simple, exstipulate, glossy, leathery and glabrous. Leaf blade is oblong-lanceolate, 8–15 cm by 4–5 cm and arranged in opposites of 3–5 sessiles. Flowers are large, tubular, bright yellow and 4–5 cm long.[1–3]

**Origin:** Native to South America; cultivated in China for medicine.[4]

**Phytoconstituents:** Allamandin, plumericin, plumieride, ursolic acid and others.[3,5–10]

**Traditional Medicinal Uses:** The plant has been used as a purgative to induce vomiting at low dosage.[3] Its leaves are cathartic and the bark is used as a hydragogue for ascites.[11] In Surinam’s traditional medicine, its roots are used against jaundice, for complications with malaria and enlarged spleen.[11]
Pharmacological Activities: Anthelmintic, Antifungal, Antineoplastic, Antivenom and Wound healing.

Dosage: No information as yet.

Adverse Reactions: No information as yet.

Toxicity: Every part of the plant was reported to be poisonous. The sap of the plant was reported to cause mild and occasional oral irritation and slight nausea when sucking cut stems. Rash or dermatitis were also reported when sap was in contact with sensitive skin.

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
4. **Aloe vera** Mill. (Aloaceae)

*Aloe, Lidah Buaya*

**Description:** *Aloe vera* Mill. is a short-stemmed, up to 50 cm, succulent herb with thick green leaves that have a sharp and pointed apex, 15–50 cm by 4–7 cm, arranged in a rosette around the short stem. Blade is green to variegated with small white or glaucous dots, irregular bands, lanceolate, tapering from base to apex, glabrous with green and spiny-toothed margins. The leaves contain a thick colourless juice. Flowers are yellow, orange or red, crowded into a rosette and in panicles.[1–3]

**Origin:** Native to North Africa; cultivated in China for medicine and widely used as indoor ornamental plants.[3,4]

**Phytoconstituents:** Aloin (barbaloin), arabinose, aloe-emodin, aloetinic acid, emodin, aloeresin A–C, aloeone, aloeride and others.[2,5–12]

**Traditional Medicinal Uses:** The plant has been used in cosmetic preparations for the treatment of pimples, acne and mouth ulcers.[2] It has also been used to control bleeding, itching of piles, and relief from arthritic pains.[2] The Chinese uses the plant juice as a mild laxative, wash for piles, abscesses and scabies. In the Philippines, it is used to treat dysentery and pain in the kidneys.[2] The plant has been found to treat bacterial infection, as a cathartic, emmenagogue, purgative and vermifuge. It can be used in the treatment of burns, oedema, pain, swellings and wounds; treatment of leukemia, lung cancer; treatment of constipation, eczema, piles and pertussis.[6,13–15] The whole
plant has also been used for the treatment of rectal fissures and piles while the root is used to treat colic.[16] The juice from the leaves is used to increase menstrual flow.[13] The jelly is used as aperient, for wounds, applied on the abdomen in fever, after confinement, on swelling and is especially useful in correcting constipation due to intake of iron medication.[17,18] Fresh juice of the leaves is cathartic and cooling and used for various eye diseases.[16] The dried juice is applied with lime juice for reducing swellings and promoting granulation in ulcers. In Malaysia, it is used for treating wounds, fever, swellings and put on the abdomen of women after confinement. The mixture of sugar with sap obtained from heated leaves is taken for asthma. The mucilaginous flesh and the sap are used for burns. The watery extract is used as a hair tonic. It is also used in cosmetics for decreasing wrinkles and other skin problems. It is mixed with milk and given for dysentery and pains in the kidney.[15] It is used in Ayurveda to alleviate pain and is also mentioned in folk medicine of Arabian Peninsula for the management of diabetes.[19]

Dosage: Single dose of powdered Aloe, 50–200 mg at bedtime; tincture BPC 1949 (1:40, 45% ethanol), 2–8 ml. Aloe should only be taken for short periods, maximum 8–10 days.[170] Doses of 10–30 mg act as a bitter stomachic; 60–200 mg as a laxative and 300–1000 mg as a purgative.[118,71] A dose of 1 teaspoon after meals, or otherwise advised by manufacturers and practitioners has been reported.[72] To prevent kidney stones, a dose of 2 to 3 tablespoon daily is reported. As a laxative, the recommended dose is 500 to 1000 mg daily. For burns or wound healing, fresh gel from plant may be applied topically and liberally. For haemorrhoids, as a stool softener, 0.05 to 2 g of dry aloe extract is administered. In the treatment of HIV, 800 to 1600 mg of acemannan daily (equivalent to 0.5 to 1 L of Aloe vera juice) is administered. To relieve constipation, 20 to 30 mg hydroxyanthracene derivatives daily, calculated as anhydrous aloin is prescribed.[73]

Adverse Reactions: Barbaloine was shown to have a laxative effect.[70] Ingestion of A. vera is associated with diarrhoea, electrolyte imbalance,
kidney dysfunction, and conventional drug interactions; episodes of contact dermatitis, erythema, and phototoxicity have been reported from topical applications.[74] A. vera could also induce acute liver damage.[75]

**Toxicity:** Severe gastrointestinal cramping can occur if the latex (which is just below the leaf surface) is taken internally.[72] Toxic doses cause severe haemorrhagic diarrhoea and kidney damage, and sometimes death. The lethal dose of the dried plant extract is stated to be 1 g/day taken for a period of several days.[76]

**Contraindications:** Contraindicated in intestinal obstruction, acute inflammatory intestinal diseases (e.g., Crohn’s disease, ulcerative colitis), appendicitis and idiopathic abdominal pain. Should not be used during pregnancy. Should not be given to children below 12 years of age.[77] Should avoid application of Aloe topically on deep, vertical wounds. Contraindicated in menstruation and if the person has kidney complaints.[72]

**Drug-Herb Interactions:** Increase the actions of cardiac glycosides and antiarrhythmic drugs (chronic use of aloe causes potassium loss), thiazide diuretics, loop diuretics, licorice and corticosteroids.[77] Aloe gel, when taken orally, can reduce the absorption of many medications. Thus, it should be taken two hours apart from all medications.[72] A study reported that Aloe vera preparations improved the absorption of both vitamins C and E.[78]
5. **Andrographis paniculata**
   (B arm.f.) Nees (A canthaceae)

Hempedu Bumi, Sambiloto, Chuan X in Lian

**Description:** Andrographis paniculata (Barm.f.) Nees is an annual herb that grows up to 1 m in height. Stems are glabrous and articulated. Leaves are simple, opposite and extipulate. Blade is dark green, bitter, glossy, simple, lanceolate, opposite and 4–8 cm by 1.3–2.5 cm. Its small and white flowers grow in terminal or axillary panicles. Both the bracts and the 5-lobed calyx are small. Fruits are upright, fusiform, capsular and contains 2–4 seeds.[1]

**Origin:** Native to Indian subcontinent and cultivated elsewhere.[2]

**Phytoconstituents:** Andrographolide, andropanolide, andrographic acid and andrographidine A, andrographatoside, andropaniculosin A and andropaniculoside A and others.[3–14]

**Traditional Medicinal Uses:** The plant is used orally to prevent and treat common cold, influenza, pharyngotonsilitis, allergies and sinusitis. Traditionally, it is used for many conditions including anorexia, atherosclerosis, insect and
snake bites, bronchitis, prevention of cardiovascular disease, diabetes, hypertension, cholera and as a tonic.\[1,15,16\]

**Pharmacological Activities:** Antiapoptotic,\[17\] Antibacterial,\[18–20\] Antifungal,\[18\] Anticancer,\[21–30\] Antidiabetic/Hypoglycaemic,\[31–36\] Antifertility,\[37\] Anti-inflammatory,\[38–48\] Antioxidant,\[45,49–51\] Antiplastelet,\[52,53\] Antiprotozoal,\[54–56\] Antiviral,\[57,58\] Cardioprotective,\[59\] Chemopreventive,\[60\] Hepatoprotective,\[61–63\] Hypotensive,\[64\] Immunomodulatory,\[35,42,65,66\] Psychopharmacological activities,\[67\] Vasorelaxant\[68\] and Cytotoxic.\[12\]

**Dosage:** For decreasing symptoms of common cold, doses of 400 mg of standardised andrographolide are required three times daily; for preventing common cold, a dose of 200 mg daily for 5 days in a week; for relieving fever and sore throat in pharyngotonsilitis, doses of 3 g and 6 g daily were used.\[16\] Use 6–9 g for influenza with fever, sore throat, ulcers in the mouth, acute or chronic cough, colitis, dysentery, urinary tract infection, carbuncles, sores and venomous snake bite.\[69\]

**Adverse Reactions:** Orally, large doses of Andrographis may cause gastrointestinal distress, anorexia, emesis and urticaria. Androgapholide taken orally at 5 mg/kg three times a day may cause headache, fatigue, rash, abnormal taste, diarrhoea, itching, lymphadenopathy, anaphylactic reactions, etc.\[16\]

**Contraindications:** Contraindicated in pregnancy, likely to be unsafe due to abortifacient effect.\[16\]

**Toxicity:** No toxic effect was observed after administration of a decoction of Andrographis paniculata leaves to rabbits.\[70\] LD<sub>50</sub> of androgapholide in mice through oral route is > 40 g/kg body weight, which indicates low toxicity.\[71\]

**Drug-Herb Interactions:** Simultaneous application of A. paniculata and warfarin did not produce significant effects on the pharmacokinetics of warfarin, and practically no effect on its pharmacodynamics.\[72\]
**6. Ardisia elliptica** Thunb. (*Myrsinaceae*)

*Mata Pelanduk/Ayam, Sea-Shore Ardisia, Shoebutton Ardisia*

**Description:** *Ardisia elliptica* Thunb. is a small shrub that can grow up to 10 m tall. The leaves are obovate, 6–9 cm long with smooth margins. They have an acute apex and a cuneate leaf base. The leaves have a leathery texture. The plant bears whitish pink axillary inflorescences and the drupes are globular, 1–1.2 cm in diameter and grow in clumps, pale red when immature, and turning dark purplish upon maturity.[1–3]

**Origin:** Native to tropical and temperate Asia.[4]

Traditional Medicinal Uses: The decoction of the leaves is used by the Malays to treat pain in the region of the heart.[10] The Kadazan Dusun tribes in Malaysia used paste made from the leaves of Ardisia elliptica to treat herpes and measles.[1,11] The fruits are used in Thai Traditional Medicine to cure diarrhoea with fever.[8]

Pharmacological Activities: Antiplatelet[10,11] and Antibacterial.[8]

Dosage: No information as yet.

Adverse Reactions: No information as yet.

Toxicity: No information as yet.

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
7. **Areca catechu** L. (Palmae)

*Betel Nut Palm, Areca Nut, Pinang*

**Description:** Areca catechu L. is a tall, slender palm that can grow up to 10 m. Leaves are dark green, pinnate and up to 1.2–2 m long. Inflorescence is branched and male flowers grow in one row surrounding the female flower at the base of branch. Fruit is a one seeded ovoid berry about 5 cm long. \(^{[1-4]}\)

**Origin:** Originate from the Philippines. \(^{[5]}\)

**Phytoconstituents:** Arecoline, arecaidin, arecaine, catechin, glucides, guvacine, guvacoline, arecolidine, isoguvacine, nicotine and others. \(^{[1,6-8]}\)

**Traditional Medicinal Uses:** In Irian Jaya, parts of this tree are used on wounds, swellings and other skin afflictions. The pericarp is effective in the treatment of flatulence, oedema, dysuria and hyperemesis of pregnancy. On the Finschhafen coast, Papua New Guinea, the inner seed is chopped, heated over fire and pressed on sores caused by sea urchins. Chewing the betel nut with lime and the leaves of catkins or *Piper betel* gives a stimulant effect as well as an attributed sedative effect. \(^{[9]}\) This may also be used to soothe a mad person. The red mixture is applied to ulcers in New Britain and to treat sores.
caused by venereal disease in Northern Province; whereas in New Ireland, the scraped bark is mixed with sea water with a leaf of Indocarpus fagiferus and drunk to treat asthma.\textsuperscript{[9]} The Malays use a decoction of the leaves to treat diarrhoea in children.\textsuperscript{[1]} The dried ripe fruits have been used by the Chinese to expel tapeworms and roundworms, treat diarrhoea, indigestion, lumbago, urinary problems and increase menstrual flow.\textsuperscript{[1,10]} The kernel of the fruit is chewed as a narcotic, fresh or cured with slacked lime and betel leaves.\textsuperscript{[2]} The fruits are also used for beriberi, dysentery, dyspepsia, dysuria, oedema and malaria.\textsuperscript{[6]} The fruit can also be applied on venereal sores (ground fresh nut with betel leaf, Nigella sativa and roots of Gymnema hirsutus, cooked in mustard oil or butter and applied).\textsuperscript{[11]}

**Pharmacological Activities:** Analgesic,\textsuperscript{[12]} Anthelmintic,\textsuperscript{[6,13]} Antibacterial,\textsuperscript{[14]} Anticancer/ Antineoplastic,\textsuperscript{[15,16]} Anticonvulsant,\textsuperscript{[17]} Antidepressant,\textsuperscript{[18,19]} Antihypertensive,\textsuperscript{[20,21]} Antimitotic,\textsuperscript{[22]} Antioxidant,\textsuperscript{[23]} Apoptotic,\textsuperscript{[24]} Hypcholesterolaemic,\textsuperscript{[25]} Immunomodulatory,\textsuperscript{[26,27]} Immunostimulatory,\textsuperscript{[28–31]} Antihyaluronidase,\textsuperscript{[32]} Antivenom,\textsuperscript{[33]} Cell growth inhibitor,\textsuperscript{[34]} Molluscicidal\textsuperscript{[35]} and causes periodontitis.\textsuperscript{[36]}

**Dosage:** For the treatment of diarrhoea, 30 g areca powder in 200 cm\textsuperscript{3} water, simmered for 1 hour is taken before breakfast. If expulsion does not take place within 9 hours, 50 cm\textsuperscript{3} of 50% magnesium sulphate solution may be taken.\textsuperscript{[11]} A decoction of the pericarp has been prescribed in a daily dose of 6 to 12 g to treat flatulence, oedema, dysuria and hyperamnesis during pregnancy. To treat diarrhoea and dysentery, a daily dose of 0.5 to 4 g of the kernel has been used.\textsuperscript{[7]} For sore throats, the pressed juice is used as a gargle. 2 g of fresh nut can be chewed for 15 min or more before spitting it out. A further reported usage is rolling the leaves and placing them betwixt teeth and gums/lips.\textsuperscript{[37]}

**Adverse Reactions:** Excessive chewing can cause dizziness, nausea, vomiting, diarrhoea, and seizures.\textsuperscript{[38]}

**Toxicity:** A dose of 8–10 g is toxic to humans.\textsuperscript{[6,39]} Heavy consumption may cause the development of cancer in the upper and middle third of the oesophagus respectively\textsuperscript{[40]} and chronic kidney disease.\textsuperscript{[41]} Betel quid (a mixture of areca nut and flavouring ingredients with or without processed tobacco leaves) chewing resulted in a statistically significant increase in the risk of total and cerebrovascular deaths in the elderly population.\textsuperscript{[42]} At higher doses, bradycardia, reflex excitability, tremor, spasms and eventual paralysis may occur. Long term effect as stimulant causes malignant tumours of oral cavity
through formation of nitrosamines. Betel quid chewing during pregnancy has a substantial effect on a number of birth outcomes, including sex ratio at birth, lower birth weight and reduced birth length. It is toxic during pregnancy as it also possesses cytotoxic and genotoxic activities.

**Contraindications:** Should not be used during pregnancy and lactation. Should not be given to children. Patients with oral or oesophageal cancers, ulcers, oesophagitis, or renal disease should avoid its use.

**Drug-Herb Interactions:** Decrease action of antiglaucoma agents. Increase action of beta-blockers, calcium channel blockers, cardiac glycosides (digoxin, digitoxin). For neuroleptics, extrapyramidal symptoms can occur. Avoid taking alcohol and atropine.
8. *Asplenium nidus* L. (Aspleniaceae)

Bird’s Nest Fern

*Asplenium nidus* L. is a common epiphytic fern found growing on trees. Fronds are long, simple, green and grow from a central rhizome attached to the tree branch in the shape of a nest. Parallel lines of spores are found on the undersides of the fronds and radiate away from the midrib towards the leaf margin.[1]

**Origin:** Native to tropical Africa, temperate and tropical Asia and Australasia.[2]

**Phytoconstituents:** Kaempferol-3-O-gentiobioside-7,4′-bisglucoside, kaempferol-3-O-diglucoside, kaempferol-3,7-diglycoside and kaempferol-3-O-vicianoside.[3]

**Traditional Medicinal Uses:** *A. nidus* is regarded as depurative. Infusion of the fronds is used to ease labour pains by Malaysia native tribes. The Malays pound the leaves in water and apply the resulting lotion to feverish head.[4] Two young fronds are eaten when they are still coiled, just after menstruation, in the morning as a contraceptive. Tea made from the fronds is recommended for general weakness.[5,6]

**Pharmacological Activities:** Oxytocic activity.[6]

**Dosage:** No information as yet.
Adverse Reactions: No information as yet.
Toxicity: No information as yet.
Contraindications: No information as yet.
Drug-Herb Interactions: No information as yet.
9. *Aster tataricus* L.f. (Compositae)

Tatarian Aster, Tatarian Daisy

**Description:** *Aster tataricus* L.f. is a small shrub with abundant fibrous roots. Leaf blades are oblanceolate to lanceolate, margins serrate or entire, 4-18 by 1-5 cm and acute. Flower heads are in large bunches with white petals and yellow centre.[1–3]

**Origin:** Native to Siberia.[3]

**Phytoconstituents:** Shinone, friedelin, epifriedelino1, shinoside A–C, asterinin A–F, astins A–E, astertarone A&B and others.[4–11]

**Traditional Medicinal Uses:** The underground rootstock is used as a purgative, treats colds, coughs with excessive sputum or with blood and painful menstruation.[2] It is also used as a bechic-expectorant.[12] Used as an aromatic tonic in chronic gastroenteritis.[13]

**Pharmacological Activities:** Anticancer[14,15] and Antioxidant.[4]

**Dosage:** No information as yet.
Adverse Reactions: No information as yet.
Toxicity: No information as yet.
Contraindications: No information as yet.
Drug-Herb Interactions: No information as yet.
10. **Azadirachta indica** A. Juss. (Meliaceae)

**Neem**

**Description:** *Azadirachta indica* A. Juss. is a tall evergreen tree, growing up to 30 m in height. Leaves are pinnate with opposite or alternate, lanceolate, serrated and glabrous 8–16 leaflets, 20–32 cm long. Flowers are yellowish white. Fruits are small, ellipsoid, about 5 cm long and green.[1–3]

**Origin:** A native of India and China, cultivated and naturalised throughout India, Malay Peninsula, Indonesia and Pakistan.[4]

**Phytoconstituents:** Azadirachtin O–Q, nimbin, deacylnimbin, salanin, nimbidin, nimbinin, nimbidol, azadirone, melianol, meliacinol, nimbothalin, nimonol, azharone and others.[3,5–28]

**Traditional Medicinal Uses:** It is used for the treatment of a variety of human and veterinary ailments including head lice, mange, fleas, fever, convulsions, leprosy, scrofula, rheumatism, asthma, worm infestations, treat bacterial infection, insecticide, local application for indolent ulcer and consumed as tonic after childbirth.[8] It is used for boils, heart disease, fever,
tuberculosis, diarrhoea, jaundice, dysentery, to promote healing, measles, smallpox, sores, inflamed gums, syphilis, leprosy, piles, urinary diseases, to expel worms, purgative, emollient, local stimulant; treat fever (crushed leaves added to lemon), disinfectant (oil from nuts), astringent, contraceptive and tonic.²⁹,³⁰ It is also used for dermatological problems in Nigeria.³¹ Neem has also been used to protect crops, stored grains and library books from insects. Neem leaves buried in grain bins are used to keep the stored crops insect-free. Crushed seeds soaked in water produce a potent pesticide that does not harm mammals, birds, earthworms and bees.³²

**Dosage:** Approximately 100 g of bark is soaked in 1 L of water and approximately 3 ml of this infusion is consumed daily for one month as a male contraceptive.³⁰

**Adverse Reactions:** Nausea, vomiting, anorexia, hypersensitivity, Reye’s syndrome (infants).¹¹¹

**Toxicity:** Mice injected with the tetranortriterpenoid fractions (>86 mg/feeding) into the tail vein died within 24 hours.⁸ Various acute, subacute and chronic toxicity tests of extracts of neem have been reported, especially on human and animal fertility.¹¹² Non-aqueous extracts appeared to be the most toxic neem-based pesticide products.¹¹²

**Contraindications:** Should not be used during pregnancy and lactation, and in children. Should not be used in persons with hypersensitivity to neem.¹¹¹

**Drug-Herb Interactions:** No information as yet.

[Authors’ Note: An extensive review¹¹² on the safety of neem derived pesticides concluded that the use of neem derived pesticides as an insecticide should not be discouraged.]
**11. Barringtonia asiatica** L. (Lecythidaceae)

Beach Barringtonia, Fish-killer tree, Putat Laut

**Description:** *Barringtonia asiatica* L. is a large tree bearing large simple leaves, 20–30 cm long which taper to the leaf base. Flowers are large and white with several white stamens. The flowers are actinomorphic and have four petals. The fruit is oblong, green, large, 8–10 cm across and contains one seed.\(^{1-3}\)

**Origin:** Native to Africa, temperate and tropical Asia and Australasia.\(^4\)

**Phytoconstituents:** A1-barrinin, ranuncoside VIII, A1-barrigenin and others.\(^4,5-7\)

**Traditional Medicinal Uses:** The plant is used to treat fungal infections,\(^8\) burns and wounds.\(^9\) The leaves are heated and used to treat stomachache and...
rheumatism in the Philippines. Its fruits are used as a fish poison and the fruit juice for controlling scabies while the seeds are used for the expulsion of intestinal worms and also as a fish poison. They are also used to treat sores, cough, influenza, sore throat, diarrhoea, swollen spleen after malaria. In other provinces of Vietnam, the fresh nut is scraped and applied to sores; dried nut is ground into a powder, mixed with water and drunk to cure coughs, influenza, sore throat, bronchitis, diarrhoea and swollen spleen. The bark is used in the treatment of tuberculosis. In Yambio (Sudan), the inner bark is crushed and mixed with water and drunk to ease the aching associated with malaria. It is also used in combination with other plants as a medicine to treat tuberculosis in New Ireland and the Solomon Islands.

**Pharmacological Activities:** Insect repellent, Antibacterial and Antifungal.

**Dosage:** To relieve the aching associated with malaria, inner bark is crushed and mixed with water and drunk, 2 cups per day for 2 days.

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
12. **Barringtonia racemosa** (L.) K. Spreng (Lecythidaceae)

Putat Kampong, Samundrapandu

**Description:** Barringtonia racemosa (L.) K. Spreng is a small tree with large, simple leaves about 20 cm long. Flowers are large with numerous pinkish stamens. The fruit is ellipsoid, green, 8 cm long, and turns red upon maturity.[1,2]

**Origin:** Native to Africa, temperate and tropical Asia, Australasia and the Pacific.[3]

**Phytoconstituents:** Nasimalun A and B, barringtonin, R1-barrigenol, R2-barrigenol, barringtogenol, barringtogenic acid and others.[4-8]
Traditional Medicinal Uses: The plant is widely used in the form of a decoction in Sri Lankan traditional medicine. The leaves and bark are used for rat and snake bites, rat poisoning and on boils. The fruits are used for cough, asthma and diarrhoea. Kernels of the drupe are mixed with milk to treat bilious diseases and jaundice whereas the seed has been used as an insecticide and tonic. The seeds along with other ingredients are employed in preparations for the treatment of itch, piles and typhoid fever, while the bark is also used for gastric ulcers. Its roots act as a coolant and deobstruent.

Pharmacological Activities: Antinociceptive, Antibacterial, Glucosidase and Amylase Inhibition, Anticancer and Cytotoxic.

Dosage: No information as yet.

Adverse Reactions: No information as yet.

Toxicity: Aqueous extracts (500, 750, 1000 or 1500 mg/kg) of *B. racemosa* bark in male rats did not produce any unwanted side effects or toxicity or alter fertility, gestational length, peri- and neonatal development and appeared to be non-teratogenic. *B. racemosa* seed extract was found to be devoid of acute and short-term toxicity to mice, when administered daily, intraperitoneally for a fortnight up to a dose of 12 mg/kg. The treated mice showed conspicuous toxic symptoms only at 24 mg/kg. The LD$_{50}$ of male mice for a single i.p. dose is 36 mg/kg.

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
13. **Bauhinia purpurea** L. (Leguminosae)

**Butterfly Tree**

*Description:* *Bauhinia purpurea* L. is a deciduous tree. Leaves are simple and stipulate. Blade is butterfly shaped, coriaceous with 9–11 pairs of secondary veins. Flowers are showy, pink and arranged in axillary. The fruits are darkish pods, 1.5 by 15 cm and woody.[1,2]

*Origin:* Native to India and grown in the Asia-Pacific as ornamental plants.[2]

*Phytoconstituents:* Bauhiniastatins 1–4, bauhinoxepin C–J, bauhibenzofurin A, bauhispirorin A, bauhinol E and others.[3–9]

*Traditional Medicinal Uses:* The root is grated with water and is drunk to treat common fever. The flowers are used as laxative and leaves applied to sores and boils, and for cough treatment.[10]
13. Bauhinia purpurea L.

Dosage: No information as yet.

Adverse Reactions: No information as yet.

Toxicity: No information as yet.

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
14. **Bixa orellana** L. (Bixaceae)

Annatto, Lipstick Tree

**Description:** *Bixa orellana* L. is a small tree with simple and spiral leaves, 10–20 cm by 6.3–12.5 cm, dark green, ovate, acuminate, truncate at the base and glabrous. Flowers are large, 5 cm in diameter, pinkish or white, arranged in terminal panicles. Fruits are dehiscent, ovoid capsules containing 15–20 trigonous seeds in bright red pulp.[1–3]

**Origin:** Originate from tropical America. Cultivated Pantropically.[4]

**Phytoconstituents:** Bixin, valencene, \( \beta \)-elemene, \( \beta \)-selinene, copaene, \( \delta \)-cadinene, spathulenol, \( \gamma \)-cadinene, \( \delta \)-elemene, ledol, \( \alpha \)-muurolene, \( \alpha \)-cadinol and others.[5–10]
Traditional Medicinal Uses: The leaves have been used to treat snakebites and jaundice and the seed is considered a good cure for gonorrhoea.[11] The bark of the root is used to treat fever and as an aperient.[11] In Cambodia, the leaves are a popular febrifuge while in Indonesia, water in which the leaves are rubbed is poured over the head of children with fever. In Malaysia, the leaves are used in a postpartum medicine and in the Philippines the leaves are pounded in coconut oil and heated, then applied to the abdomen to relieve tympanites. Pastes of the fresh leaves are rubefacient and used in dysentery. In Vietnam, lotions or baths of leaves are used during fever. Its unripe fruits are emollient in leprosy.[3] Alcoholic extracts of seed coat are taenifuge and laxative.[3] Decoctions of barks are used for catarrh. Infusions of seeds are used to treat asthma and excessive nasopharynx mucus production.[3] Traditionally, it is also used as a gargle for sore throats and oral hygiene.[12] In Trinidad and Tobago, the leaves and roots are used for hypertension, diabetes and jaundice.[13] Leaves and seed pods are used as a female aphrodisiac.[14]

Dosage: Approximately 9 seed pods are boiled in 3 cups of water for 10 mins and drunk as a diuretic before each meal. 10 g powdered seed/40 ml oil for topical pastes.[25] As a female aphrodisiac, 3 leaves in 0.5 L of water and red paste of seed pods.[14]

Adverse Reactions: Urticaria and angiooedema are possible adverse reactions with annatto dye. A patient developed these symptoms and hypotension within 20 min of ingestion of annatto containing fibres.[3]

Toxicity: Toxic to dogs dosed with 60 mg/kg trans-bixin.[26] However, annatto containing 5% bixin was non-genotoxic and non-carcinogenic to rat livers even at the highest concentration tested at 1000 ppm (4.23 bixin/kg body weight/day).[27] An annatto given through gavage to Wistar rats on days 6–15 of pregnancy showed no adverse effect on the mothers and foetus.[28]

Contraindications: Trans-bixin is hyperglycaemic and should not be ingested by patients with diabetes mellitus.[25]

Drug-Herb Interactions: No information as yet.
15. **Calophyllum inophyllum** L. (Guttiferae)

Indian Laurel, Penaga Laut, Borneo Mahogany

**Description:** Calophyllum inophyllum L. is a large tree with broad, glossy, leathery, elliptic-oblong leaf blades, 8–16 cm by 4–8 cm, and with numerous parallel side veins. The tree bears sweetly scented white flowers in erect racemes. Fruits are globose, 2 cm across and are green in colour.[1,2]

**Origin:** It is found in Africa, tropical and temperate Asia, Australasia and the Pacific.[3]

**Phytococonstituents:** Inophynone, canophyllol, canophyllic acid, calophylholide, inophyllolide, inophyllum B, C, P, and E, jacareubin, (+)-calanolide A, inocalophyllins A and B, calophinone, calophyllumin C, inophyllin A and others.[4–28]

**Traditional Medicinal Uses:** The whole plant is used as a crude drug for curing rheumatism and skin affections in South India.[14] Its juice is a purgative and the seed oil is specific for rheumatism and various skin diseases (i.e., scabies, ringworm and dermatosis). The bark is used for internal haemorrhage and as an astringent.[29] In Buso, Papua New Guinea, the milky latex from the leaves is diluted with water and the solution is applied to irritated eyes.[30] The gum is emetic and purgative.[29]

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** The unrefined oil is toxic.[41] There was a significant difference in the plasma cholesterol levels of the rats fed with *C. inophyllum* oil when compared with the control. Mild, focal to severe and widespread lesions were found in the kidneys, hearts and livers of rats fed with *C. inophyllum* seed oil.[42]

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
16. Cananga odorata (Lam.) Hook. f. & Th.
(A nnonaceae)
Kenanga, Ylang-Ylang

**Description:** Cananga odorata (Lam.) Hook. f. & Th. is a shrub which grows to a height of 4 m. Its bark is grey and smooth. Leaves are simple, alternate, exstipulate, oblong to broadly elliptic, large, 3–6.5 cm across, 8.5–29 cm long, with distinct venation pattern. Flowers are fragrant, in clusters on older branches. Fruit turns black on maturity and has many seeds in two rows.[1–3]

**Origin:** Originates from Indochina, Malesia and tropical Australia.[4]

**Phytoconstituents:** Acetogenin, aporphine, liriodenine, canangone, α-humulene, β-cubebene, germacrene D, cananodine, γ-eudesmol and others.[3,5–7]

**Traditional Medicinal Uses:** It is used for asthma, malaria, fever, cholera, typhoid, scabies, dermatitis, ulcer and wounds.[8] The seeds are used for stomach complaints with fever and in Indonesia, the bark is used for scabies.[3] In Malaysia, a paste of fresh flowers is applied to the chest for asthma and to treat malaria. In Solomon islands, a paste of fresh flowers is applied to boils while in India, the essential oil from the flowers makes an external remedy for cephalgia, ophthalmia and gout.[3,9]

Dosage: No information as yet.

Adverse Reactions: No information as yet.

Toxicity: A 50% ethanolic root bark extract administered orally to male albino rats at the dose of 1 g/kg body weight/day for 60 days resulted in decreased epididymal sperm motility and sperm count, and morphological abnormalities in the sperms.[17] However, it is non-toxic at the current level of intake as a food ingredient (0.0001 mg/kg/day). Although sometimes Ylang-Ylang oil has been reported to cause dermal sensitisation reactions in animals and humans, it is unclear what constituent(s) within the essential oil comprise the offending agent.[18]

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
17. **Capsicum annuum** L. (Solanaceae)

**Chilli, Red Pepper**

**Description:** *Capsicum annuum* L. is a small herb that can grow up to 1 m tall. Leaves are oblong-ovate, ovate, or ovate-lanceolate, 4–13 cm by 1.5–4 cm with entire margin. Flowers are small, white or tinged purple. Fruits are mostly red, but can be green, orange, yellow and can grow up to 15 cm. Seeds are pale yellow, discoid or reniform and 3–5 mm.\(^1\)\(^-\)\(^5\)

**Origin:** Native to Mexico and South America, widely cultivated throughout the world.\(^5\)

**Phytoconstituents:** Capsaicin, capsicosides E–G, capsianosides I–4, capsianosides VIII, IX, X, XIII, XV and XVI, solanidine, solanine, solasdine, scopoletin and others.\(^6\)\(^-\)\(^15\)

**Traditional Medicinal Uses:** The leaves are used to treat toothache. The fruits are used to stimulate gastric activities and increase blood circulation.\(^4\) It is also a stimulant, carminative, and used locally for neuralgia and for rheumatism.\(^15\) Uterine pain associated with childbirth is treated with soup
containing the fruit. The Commission E approved Capsicum annuum for painful muscle spasms in areas of shoulder, arm and spines. Preparations are used to treat arthritis, neuralgia, lumbago and chilblains.

**Pharmacological Activities:** Antibacterial, Antifungal, Anticancer, Antioxidant, Antiprotozoal, Hypocholesterolaemic/Hypolipidemic, Immunomodulatory, Antimutagenic and Pesticidal.

**Dosage:** Liquid extract is prepared by percolating 100 gm of the plant extract with 60 mg of ethanol, to be used as an antirheumatic. External daily dose of semi solid preparations containing maximum of 50 mg of capsaicin in 100 gm neutral base is also used as an antirheumatic and applied to the affected area not more than 3 or 4 times daily.

**Adverse Reactions:** Internally, it may cause gastrointestinal cramping, pain, and diarrhoea. Topically, it may cause painful irritation of mucous membrane.

**Toxicity:** Oral LD50 values for capsaicin are 161.2 mg/kg (rats) and 118.8 mg/kg (mice), with haemorrhage of the gastric fundus observed in some of the animals that died. However, capsaicin is considered to be safe and effective as an external analgesic counterirritant. Rabbits fed with C. annuum powder at 5 mg/kg per day in the diet daily for 12 months showed damaged liver and spleen. A rabbit skin irritation test of C. annuum fruit extract at 0.1% to 1.0% produced no irritation but caused neoplastic changes in the liver and intestinal tumours were observed in rats fed red chili powder at 80 mg/kg per day for 30 days. High doses administered over extended period of time can cause chronic gastritis, kidney damage, liver damage and neurotoxic effects.

**Contraindications:** Should not be used during pregnancy and lactation, in people with hypersensitivity and in children. Should not be used on open wounds or abrasions, or near the eyes.

**Drug-Herb Interactions:** Reported with concomitant administration with aspirin and salicylic compounds. Decrease the actions of α-adrenergic blockers, clonidine (anti-hypertensive) and methyldopa (antihypertensive). Hypertensive crisis with monoamine oxidase inhibitors.
18. **Cassia fistula** L. (Leguminosae)

Golden Shower Tree, Indian Laburnum, Purging Cassia

**Description:** Cassia fistula L. is a large tree, which grows to 10 m tall. Leaves are alternate, pinnate, 3–8 pairs of leaflets, broadly ovate and pointed. Flowers are dense, bright yellow and about 4–5 cm across. Fruit pods are long, 30–60 cm, cylindrical, brown in colour and contains many seed.[1–3]

**Origin:** Native to India and Sri Lanka.[2,4]

**Phytoconstituents:** Fistucacidin, chrysophanic acid, chrysophanol, clitorin, sennosides A and B, chrysophanein and others.[2,4–9]

**Traditional Medicinal Uses:** The whole plant is used for anthrax, burns, cancer, constipation, convulsions, delirium, diarrhoea, dysentery, dysuria, epilepsy, fever, influenza, gravel, haematuria, pimples, syphilis, tumours and worms.[4,10] The leaf is used for skin diseases (juice), healing ulcers, for ringworm and irritation of skin (juice of young leaves), facial paralysis and rheumatism (paste).[10] The raw black pulp found between the seeds is a
popular remedy for constipation.\textsuperscript{[3,4]} It is also used as a cathartic, for rheumatism and snakebite (pulp), treats bacterial infections (pulp mixed with leaves of \textit{Cassia angustifolia}), liver complaints, heart disease, reduce fever, as abortifacient, demulcent and is useful in liver, throat, eye diseases, convulsions and sores. The seed is an emetic, carminative, appetiser, and is used for constipation, jaundice, cancer on face and syphilis.\textsuperscript{[10]} The roots act as a purgative while the rootbark is used for cleansing wounds.\textsuperscript{[4]} The root is also used as an astringent, tonic, febrifuge, for skin diseases, leprosy, tuberculous glands, syphilis and epilepsy.\textsuperscript{[10]}

**Pharmacological Activities:** Antimicrobial,\textsuperscript{[11–14]} Anticholinergic,\textsuperscript{[15]} Antifertility,\textsuperscript{[16]} Anti-inflammatory,\textsuperscript{[17]} Antineoplastic,\textsuperscript{[18]} Antioxidant,\textsuperscript{[19–22]} Depressant,\textsuperscript{[23]} Hepatoprotective,\textsuperscript{[24–26]} Hypcholesterolaemic,\textsuperscript{[27]} Antileishmanial,\textsuperscript{[28]} Larvicidal\textsuperscript{[29]} and Wound healing.\textsuperscript{[30,31]}

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** In cases of overdose or prolonged administration, loss of electrolytes, especially potassium ions, aldosteronism, albuminuria, haematuria, inhibition of intestinal motility and muscle weakness may occur. Rarely, cardiac arrhythmia, nephropathy, oedema, and accelerated osteoclasia may arise.\textsuperscript{[32]}

**Contraindications:** Contraindicated with acute inflammatory diseases of intestine and appendicitis. Should not be used during pregnancy and while nursing. Should not be used in children under 12 years of age.\textsuperscript{[32]}

**Drug-Herb Interactions:** Interaction with anthranoid laxatives.\textsuperscript{[33]} Enhancement of effects of cardioactive steroids may occur. Effects of antiarrhythmics may also be affected.\textsuperscript{[32]}
19. **Catharanthus roseus** (L.) G. Don  
(*Apocynaceae*)  
Madagascar Periwinkle, Rose Periwinkle

**Description:** *Catharanthus roseus* (L.) G. Don is a herb, up to 80 cm tall. Stem is woody, slightly branched and all parts contain white milky latex. Leaves are simple, dark green, glossy, obovate-elliptic, 4–5 cm by 2–3 cm with prominent lateral veins on the abaxial surface. Flowers are bisexual, white, purple, pink, red or white with a red or pink centre. Fruits consist of pairs of greenish succulent follicles, 2–3 cm long and contain small oblong seeds.[1,2]

**Origin:** Native to Madagascar. Cultivated or naturalised in all tropical countries.[2,3]

**Phytoconstituents:** Vinblastine, vincristine, leurosine, akuammicine, carosine, catharanthine, catharicine, catharine, catharosine, cathaline, catharanthiole, vindoline, vindolinine, vincaleucoblastine, secologanin, mauritianin, rosicine and others.[4–11]

**Traditional Medicinal Uses:** The plant is used as a remedy for diarrhoea, malaria, diabetes, astringent, diaphoretic, bechic, emmenagogue, menstrual pain, hypertension, insomnia and depurative after parturition in Indochina,
the Philippines, Jamaica, West Indies, South Africa, Southeast Asia, India and Queensland. The plant is also used for cold, cough, fever and bronchitis. In Malaysia, the crushed leaves are applied to scalds, burns, sores, mumps, swollen neck, tonsillitis and insect bites. In Puerto Rico and Cuba, the flowers are decocted and used as an eyewash.

**Pharmacological Activities:** Anti-cancer/Antineoplastic, Anti-oxidant, Antiangiogenic, Chemopreventive, Hypoglycaemic and Wound healing.

**Dosage:** Leaves are useful in treating oliguria, haematuria, diabetes mellitus, and menstrual disorders in a daily dose of 4 to 8 g as a decoction or liquid extract. A decoction of 30 g of the plant is taken for diabetes, dysentery, enteritis, menstrual pains, hypertension, insomnia and cancer in Malaysia. For the treatment of cold and sore throat, tea is made from 9 pink flowers in 1 pint of water and sipped throughout the day. Dilute infusions of roots are used to treat diabetes.

**Adverse Reactions:** Catharanthus roseus pollen can trigger IgE-mediated respiratory allergy in the people living in close proximity.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.

[Authors’ Note: Clinically, vinblastine and vincristine are administered by intravenous injection as solutions of their sulphate salts.]
20. **Celosia argentea** L. (Amaranthaceae)

Feather Cockscomb, Red Spinach

**Description:** *Celosia argentea* L. is an annual tropical herb, up to 1 m tall. Stems are cylindrical and the aerial part is branched. Leaves are simple, small, spirally arranged, about 5–8 cm by 1–3 cm, alternate and exstipulate. The blade is lanceolate and ovate. The apex is acuminate. It bears several pinkish or white flowers which are minute. The fruits are globose and seeds are black.[1–5]

**Origin:** Native to India.[6]

**Phytoconstituents:** Celosian, nicotinic acid, celogenamide A, celogentin A–D, H, J and K, moroidin and others.[3,5,7–11]

**Traditional Medicinal Uses:** *C. argentea* is used internally for haematological and gynaecologic disorders and externally to treat inflammation and as a disinfectant. The whole plant is used to treat dysentery and dysuria, and used externally as poultices for broken bones.[5] The plant is used for eye

Flowers of *Celosia argentea*  
Celosia argentea plant
and liver ailments in Yunnan, China\[^{12}\] and also for the treatment of mouth sores and blood diseases and used as an aphrodisiac.\[^{13}\] The petioles are used to treat sores, wounds, boils and swellings.\[^{4,12}\] The seeds are used for the treatment of conjunctivitis and hypertension. In China, the seeds are used for haemorrhage, menorrhagia and ophthalmia.\[^{5,12,14}\] In Indonesia, the flowering tops are used for bleeding lungs whereas in Malaysia, the red flowering tops are prepared as decoctions which are given in cases of white discharges, excessive menstruations, haematuria, dysentery, proteinuria, bleeding piles and bleeding nose.\[^{5}\]

**Pharmacological Activities:** Antibacterial,\[^{15}\] Antimitotic,\[^{16}\] Antineoplastic,\[^{17}\] Diuretic,\[^{5}\] Hypoglycaemic,\[^{18}\] Hepatoprotective,\[^{11,19}\] Immunomodulatory,\[^{5,17,20}\] Cytoprotective\[^{21}\] and Wound healing.\[^{22}\]

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** Leaves should not be eaten by menstruating women.\[^{23}\]

**Drug-Herb Interactions:** No information as yet.
21. **Centella asiatica** (L.) Urban (Umbelliferae)

Indian Pennywort, Asiatic Pennywort

**Description:** *Centella asiatica* (L.) Urban is a creeping, perennial herb with long slender horizontal stolons, characterised by long internodes. Leaves are green, fan-shaped or round-reniform, 1–4 cm by 1–7 cm with a crenate or dentate margin. Flowers are umbels with white or light purple-to-pink petals and bear small oval fruit.[1,2]

**Origin:** Native to India, found in tropical America, Africa, West Pakistan, China, Japan and the Pacific.[3]

**Phytoconstituents:** Asiaticoside, asiatic acid, brahmic acid, brahmoside, centellic acid, centellose, indocentelloside, madecassic acid, madecassoside, thankuniside, vellarin, bayogenin, centellin, asiaticin, and centellicin.[4–15]
**Traditional Medicinal Uses:** The plant is used in cooling drinks when boiled, for diarrhoea, diuretic, gravel, leprosy treatment, stones, wound healing and as a tonic.\(^{[2,4]}\) It is also part of a mixture to treat colic in Indonesia.\(^{[16]}\) The Chinese uses it to improve appetite, aid digestion, treat sores and ulcers. In India, it is used to treat skin, nervous system and blood diseases.\(^{[5,7,17]}\) The plant is used to treat fever and rheumatism, as a detoxicant, sedative and peripheral vasodilator.\(^{[17,18]}\) The plant is reported as treatment for cancer, circulatory stimulant, hypotensive, stimulant, tonic, cicatrizant (leaf), used for the treatment of haematuria, gonorrhoea, peptic ulcer and sore throat.\(^{[5]}\) It is also used for tuberculosis, headache (decoction), dysentery (decoction with other ingredients), boils and tumours (paste applied), leucoderma, anaemia, urinary discharges, bronchitis, insanity, leprosy (decoction), mental deficiency, dysentery (juice or paste on empty stomach for 2–3 days), cough (decoction with ginger and black pepper), cooling (paste with pepper and salt), tonic (juice with palm jaggery given to women after childbirth), elephantiasis, enlarged spleen (ointment from leaves), cures stuttering or stammering, diuretic, small pox and as a local stimulant.\(^{[19]}\) External application in the form of poultices is prescribed for contusions, closed fractures, sprain and furunculosis.\(^{[18]}\)

**Pharmacological Activities:** Anti-bacterial,\(^{[20]}\) Antidepressant,\(^{[21]}\) Anti-emetic,\(^{[22]}\) Antineoplastic,\(^{[8,23–26]}\) Antioxidant,\(^{[27–32]}\) Antithrombotic,\(^{[33]}\) Anxiolytic,\(^{[34,35]}\) Gastroprotective,\(^{[9,36]}\) Immunomodulatory,\(^{[37,38]}\) Antigenotoxic,\(^{[39]}\) Nerve-regenerative,\(^{[40]}\) Radioprotective\(^{[41,42]}\) and Wound healing.\(^{[43,44]}\)

**Dosage:** Approximately 0.6 g dry weight of whole plant taken three times a day (condition not indicated).\(^{[45]}\) Larger amounts of fresh leaves are sometimes eaten as vegetable and dietary supplement.\(^{[45]}\) 60 mg of *C. asiatica* extract given daily for varicose veins,\(^{[46]}\) 30 or 60 mg of Total Triterpenic fraction of *Centella asiatica* (TTFCA) three times a day for improving venous hypertension.\(^{[47]}\) Titrated extract of *C. asiatica* given 60 or 120 mg daily for chronic venous insufficiency.\(^{[48]}\) For the treatment of fever, measles, haematemesis, epistaxis, diarrhoea, dysentery, constipation, leucorrhoea, jaundice, dysuria, furunculosis, dysmenorrhoea, varices, daily dose of 30 to 40 g of fresh plant in the form of extracted juice or decoction is taken.\(^{[18]}\)

**Adverse Reactions:** Allergic contact dermatitis.\(^{[49]}\) Sedation, increased blood glucose and cholesterol levels.\(^{[50]}\)

**Toxicity:** Hepatotoxic.\(^{[51]}\)
Contraindications: Should not be used during pregnancy and lactation and not to be given to children.\cite{50}

Drug-Herb Interactions: Reported with ephedrine, theophylline, atropine and codeine.\cite{52} Decrease effectiveness of antidiabetic and antilipidemic drugs.\cite{50}

[Authors' Note: Topical creams containing the active component asiaticoside is available commercially for wound healing.]
22. **Cerbera odollam** Gaertn. (Apocynaceae)

Pong Pong Tree, Indian Suicide Tree, Sea Mango

**Description:** *Cerbera odollam* Gaertn. is a medium-sized tree with smooth and grey bark. Leaves are simple, few, without stipules, 12–16 cm by 3–5 cm, arranged in a spiral. The blade is succulent, dark green, glossy and lanceolate. Flowers are white, large and bisexual with a yellow eye in the throat of the corolla tube and arranged in terminal. Fruits are round, waxy surfaced, large, 5–10 cm across, with fibrous husk covering the single seed. The fruit turns from green to reddish brown upon maturity.[1-4]

**Origin:** Native to Indian subcontinent, Indochina, Malesia and the Pacific.[5]
Phytoconstituents: Cerberin, cerleaside A, 17α-nerifolin, 17β-nerifolin, thevetin B, acetyl-thevetin B, diacetylneriifolin, cerberoside, odollin and others.[3,6–12]

Traditional Medicinal Uses: In Malaysia, rheumatism is treated with embrocations of the fruits.[11] The seeds are poisonous and have been used to poison rats and dogs.[3,11] The seeds are also narcotic. In Indonesia, oil obtained from the seeds is rubbed on the body as remedy for colds, scabies, and rheumatism. In the Philippines, oil of the seeds is also used to treat rheumatism.[11] It is used in Burma as an insecticide or insect repellent when mixed with other oils.[13] The bark, latex and roots are used as purgatives and emetics in India.[13,11,13]

Pharmacological Activities: Antineoplastic[8,10] and Antipsychotic.[14]

Dosage: No information as yet.

Adverse Reactions: No information as yet.

Toxicity: Seeds are poisonous and have been used to poison rats and dogs.[3,11] The seeds have a long history as an ordeal poison in Madagascar, due to the highly toxic cardiac glycosides they contain. The kernel contains cerberin, cerberoside and odollin which are toxins.[15] Humans poisoned by oral consumption of half to one seed kernel would result in sinus bradycardia, wandering pacemaker and second-degree sino-atrial block and nodal rhythm.[15,16] Other symptoms include nausea, retching and vomiting.[16] The poisoning may result in hyperkalemia, which can cause death.[17]

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
23. **Cissus quadrangularis** L. (Vitaceae)

**Grape Leaf, Veld Grape**

**Description:** *Cissus quadrangularis* L. is a herbaceous plant with a thick, quadrangular, succulent stem and is constricted at regular intervals. It has long, slender and simple tendrils. Leaves are ovate, entire, crenate-serrate, 3–5 cm by 5–13 cm and glabrous on both sides. Flowers are pink and white, 2 mm long, while the berries contain one or two seeds.¹ ²

**Origin:** India, Pakistan, Indonesia, Malaysia, East Africa, Sri Lanka and Arabia.²

**Phytoconstituents:** Quadrangularins A–C, δ-amyrin, δ-amyrone, resveratrol, piceatannol, pallidol, parthenocissine A and others.³ ⁷

**Traditional Medicinal Uses:** Whole plant is used for urinary schistosomiasis in Mali.⁸

Dosage: No information as yet.

Adverse Reactions: No information as yet.

Toxicity: No information as yet.

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
24. **Cocos nucifera** L. (Palmae)

Coconut Palm, Kelapa

**Description:** *Cocos nucifera* L. is a tall palm with a ringed stem that can grow up to 30 m tall. Leaves are pinnate, 2–6 m long with numerous pairs of narrow leaflets. Flowers are arranged in large panicles among the leaves with female flowers near the base of the inflorescence. The fruit is symmetrical, ovoid and about 20–30 cm across. Thick fibrous husk encloses the hard shell (endocarp) in which the fleshy pericarp adheres.[1,2]

**Origin:** Native to the Pacific.[3]
Phytoconstituents: Trans-zeatin, dihydrozeatin, dihydrozeatin-O-glucoside, meta-topolin riboside, N⁶-isopentenyladenine, N⁶-benzylaminopurine and others.⁴,⁵

Traditional Medicinal Uses: Its fruit juice is used to treat poisoning, cholera and is a diuretic. Fresh coconut juice with rice flour is poulticed onto carbuncles, gangrenous sores and indolent ulcers.⁶ Coconut water is also used for fever, urinary complaints and to stop vomiting.⁷ Juice of the green, unripe coconut is boiled and drunk to relieve diarrhoea. In Somoa, coconut oil is used as a laxative and to relieve stomach ailments.⁸ The decoction of husk fibre has been used in northeastern Brazil traditional medicine for the treatment of diarrhoea and arthritis.⁹ Coconut water has also been used as short-term intravenous hydration and resuscitation fluid in emergencies.¹⁰ The rootbark is used as an astringent, styptic and in haemorrhages.⁶ It is also used for uterine diseases, bronchitis, liver complaints and dysentery.⁷

Pharmacological Activities: Analgesic,¹¹ Antibacterial,⁹,¹² Antifungal,¹³ Antineoplastic,¹⁴,¹⁵ Antioxidant,¹¹,¹⁶ Antiprotozoal,¹⁷ Antiviral,⁹ Hypoglycaemic,¹⁸ Hypolipidaemic,¹⁹,²⁰ Hypotensive,²¹ Immunomodulatory²² and Antitrichomonal.²³

Dosage: No information as yet.

Adverse Reactions: A case report of occupational allergic conjunctivitis due to coconut fibre dust has been reported.²⁴

Toxicity: No information as yet.

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
25. **Coix lacryma-jobi** L. (Gramineae)

Job’s Tears, A dlay

**Description:** Coix lacryma-jobi L. is a small herbaceous plant which grows up to 2.5 m. Leaf sheaths are glabrous and the leaf blades are narrowly lanceolate, 20–50 cm by 1.5–4 cm. The midrib is prominent. Fruit is tear-shaped, 8 mm by 1.1 cm, with glossy berries which turn black upon maturity.\(^1\)\(^-\)\(^3\)

**Origin:** Native to tropical and temperate Asia.\(^4\)

**Phytoconstituents:** Coixol, coixenolide, \(\alpha\)-coixins, \(\gamma\)-coixins, syringaresinol, mayuenolide, coixan A–C, coixinic acid and others.\(^5\)\(^-\)\(^9\)

**Traditional Medicinal Uses:** A decoction is believed to benefit the blood and breath and used to wash newborns to prevent diseases.\(^10\) The kernels are used to treat lung and chest complaints, rheumatism, dropsy and gonorrhoea.\(^3\)

Fruit is used for intestinal or lung cancers and warts. The fruit is also used as a vermifuge and for hypertension. As the seed is diuretic and refrigerant, a decoction is used for appendicitis, arthritis, beriberi, bronchitis, cancer, diarrhoea, dryskin, dysuria, oedema, hydrothorax, inflammation, pleurisy, pneumonia, pulmonary abscesses, rheumatism and tuberculosis.\(^10,11\) Seeds are also used for the treatment of enteritis, persistent diarrhoea in children, urinary lithiasis, rheumatism and acrodynia.\(^12\) An infusion of the seeds is prescribed for bronchitis, pulmonary abscess, pleurisy and hydrothorax.\(^11\)

The root is given along with roots of long pepper and other herbs for fever.
with drying of saliva and intense thirst, for dysentery, diarrhoea and puerperal fever.\textsuperscript{[13]}

**Pharmacological Activities:** Anti-inflammatory,\textsuperscript{[14,15]} Anticancer/Antineoplastic,\textsuperscript{[16–21]} Antioxidant,\textsuperscript{[8,18]} Hypoglycaemic,\textsuperscript{[9,22]} Hypolipidaemic\textsuperscript{[22–24]} and Hypotensive.\textsuperscript{[25]}

**Dosage:** For the treatment of enteritis, persistent diarrhoea in children, oedema, urinary lithiasis, rheumatism and acrodynia, doses of 10 to 30 g daily in the form of powder or decoction are given.\textsuperscript{[12]}

**Adverse Reactions:** No information as yet.

**Toxicity:** Embryotoxicity in pregnant rats was observed. Oral administration of 1 g/kg body weight of water extracts caused an increase in foetal resorptions and postimplantation mortality.\textsuperscript{[26]}

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
26. *Crinum asiaticum* L. *(Amaryllidaceae)*

*Crinum Lily, Spider Lily, Bawang Tanah*

**Description:** *Crinum asiaticum* L. is a bulbous herb with a flowering stalk in the centre of the plant. The leaves are narrowly lanceolate, acuminate, 0.5–1.5 m long, greenish and have a hairy texture. The flowering stem is about 1–1.2 m. Flowers are white, 6–12 in an umbel. Filaments are reddish. The fruit is irregularly globose, 4–5 cm across, with one or a few large green seeds.[1–4]

**Origin:** Native to Tropical Asia, introduced in Northern America.[5]

**Phytoconstituents:** Crinamine, lycoricidine, hamayne, isocraugsodine, palmilycorine, lycorische, ambelline, crinasiatin, hippadine, bakonine, pratomrimine, crinine, powelline, ungeremine, criasbetaine, crinasiatine, phenanthridone II and others.[6–17]

**Traditional Medicinal Uses:** In Southeast Asian countries, *C. asiaticum* has a considerable medicinal reputation as a potent folk medicine in the treatment
of injury and inflamed joints.\cite{18} The plant has been used for carbuncles and cancer.\cite{7} In Indonesia, the oiled and heated leaves are useful to treat wounds by poisoned arrows, bites and stings. In Malaysia, poultices of the leaves are applied to swellings, swollen joints, lumbago, pains and in cases of headache and fever. The leaves are also an emollient. In Northwest Solomon Islands, the leaves make a topical treatment for inflammation.\cite{19} In Malaysia, the leaves are used as a rheumatic remedy and to relieve local pain.\cite{18} On Karkar Island and in Simbu, Papua New Guinea, the latex from the leaves is applied to cuts. In India, the leaves are applied to skin diseases and inflammation.\cite{20} The crushed leaves are used to wash piles or mixed with honey and applied to wounds and abscesses.\cite{3} Its seeds are considered purgative and emmenagogic.\cite{7} In the Trobriands, Papua New Guinea, the stem fibres are used to stop bleeding and in New Ireland, the milky sap from the stem is used for stonefish wounds.\cite{20} The bulb is an emetic and counter-irritant. In Papua New Guinea, juice obtained from bulb is ingested regularly for 2 months to treat gonorrhoea. In the Philippines, the bulbs are crushed and applied as an ointment.\cite{19} Juice from the fresh bulbs, taken several times per month induces vomiting. It is also instilled in the ear to treat otitis.\cite{21} The root is also an emetic, diaphoretic and nauseant when fresh.\cite{22} In a Finschhafen area village, Papua New Guinea, the cut root is cooked in a banana leaf, then cooled and placed on an aching tooth. Roots are used in New Caledonia, Indonesia, and Malaysia in a poultice for wounds, ulcers and swellings.\cite{20}

**Pharmacological Activities:** Analgesic and Antibacterial,\cite{19} Anti-inflammatory,\cite{18} Anti-viral,\cite{18,23} Anti-cancer,\cite{13,24} Anti-tumour,\cite{15} Mast cells degranulation,\cite{10} Anti-mitotic and Membrane stabilising.\cite{8}

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
27. *Cymbopogon citratus* (D.C.) Stapf. (Gramineae)

Lemon grass

Description: *Cymbopogon citratus* (D.C.) Stapf. is a grass composed of dense leafy clumps that grows up to 1.8 m tall. Leaf sheath is tubular and acts as a pseudostem, 12–25 cm long, thickening towards the base and 1–2 cm in diameter. Leaf blades are sessile, simple, green, linear, glabrous, 60–90 cm by 1–2 cm, and possess parallel venation. Inflorescence is a raceme.[1–3]

Origin: Native to South Asia, Southeast Asia and Australia.[3]

Phytoconstituents: Citral, citronellal, cymbogonol, α-terpineol, citronellic acid, α-camphorene, geranial, isoorientin, isoscoparin and others.[1,4–8]

Traditional Medicinal Uses: The plant is used to treat digestive problems and relieve cramping pains.[4] A decoction of the plant is used by the Chinese to treat coughs, colds and blood in sputum.[2,9] The entire plant is used to treat
bacterial infection and possesses fever-reducing and stomachic properties.\[^5\]

In many Asian countries, leaves in water provide a bath to reduce swelling, to remove body odour, improve blood circulation, treat cuts, wounds, bladder problems and leprosy.\[^9\] Its oil is used as an insect repellent, for aerosols, deodorants, floor polishes and household detergents.\[^4,5\] The oil is carminative for cholera, and is prescribed for dyspepsia, vomiting, fever, and headache,\[^10\] and used externally to treat eczema.\[^5\] Its roots are taken to induce sweating, increase flow of urine,\[^9\] treat coryza and influenza.\[^5\]

**Pharmacological Activities:** Analgesic,\[^11,12\] Anthelmintic,\[^13\] Antibacterial,\[^14-18\] Antifungal,\[^16,19-25\] Anticancer/Antineoplastic,\[^26,27\] Antimalarial,\[^28\] Antioxidant,\[^8,29,30\] Antiplatelet,\[^31\] Hepatoprotective,\[^32\] Hypoglycaemic,\[^33\] Sedative,\[^34\] Vasorelaxant,\[^35\] Antiinflammatory,\[^36\] Insecticidal\[^37\] and Radioprotective.\[^38\]

**Dosage:** A dose of 10 to 20 g of roots is used for treating coryza, influenza and fever. It is also prescribed for dyspepsia and vomiting and as a carminative, by using 3 to 4 drops of the essential oil diluted in water.\[^5\]

**Adverse Reactions:** Application of thick ointments with the volatile oil on the skin has led to rare incidence of allergy.\[^39\]

**Toxicity:** Asteatolitis occurred as a result of inhalation of the volatile oil.\[^39\] It is also reported to be cytotoxic and genotoxic.\[^40\]

**Contraindications:** Should not be used during pregnancy.\[^41\]

**Drug-Herb interactions:** No information as yet.
28. *Dolichos lablab* L. (Leguminosae)

Lablab Bean, Hyacinth Bean

**Description:** *Dolichos lablab* L. is a woody climbing herb which can reach a length of 5 m. Leaves are pinnate and generally 3-foliolate. Leaflets are acute, entire, 6-12 cm by 5-9 cm. Flowers are white or purplish pink. Fruits are green pods, 6 cm long by 2 cm wide, flattened, contain 4–5 seeds and turn light brown when mature.[1–4]

**Origin:** Native to Africa.[5]

**Phytoconstituents:** Dolichin, arabinogalactan 1 & 2, lablabosides A–F, phytin, pantothenic acid, saponin I, putrescine, spermidine, spermine and others.[3,6–14]

**Traditional Medicinal Uses:** The plant is decocted for alcoholic intoxication, cholera, diarrhoea, globefish poisoning, gonorrhoea, leucorrhoea and nausea.[15] Its seeds are used to stimulate gastric activities, as antidote against poisoning, to treat colic, cholera, diarrhoea, rheumatism and sunstroke.[4,16] The juice from the fruit pods are used for inflamed ears and throats. The fruit is also astringent, digestive, stomachic and used to expel worms. The seeds
are reportedly alexiteric, aphrodisiac, febrifuge, stomachic and used for menopause and spasms.\textsuperscript{[15]} The flowers are used to treat dysentery, inflammation of uterus and to increase menstrual flow.\textsuperscript{[4,15]} They are also used for leucorrhoea, menorrhagia, and summer heat disorders, as they have alexiteric and carminative properties.\textsuperscript{[15]}

**Pharmacological Activities:** Antifungal\textsuperscript{[6,17]} Antiviral\textsuperscript{[6]} and Haemagglutinating activities\textsuperscript{[18–20]}

**Dosage:** The reported dose of the seeds is 8 to 16 g daily in the form of powder or a decoction for the treatment of nausea, vomiting, diarrhoea, enteritis, abdominal pains and alcoholism.\textsuperscript{[21]}

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
29. **Elephantopus scaber** L. (Compositae)

**Description:** *Elephantopus scaber* L. is a tropical herb that can grow up to 30–60 cm tall. Leaves are simple, without stipules and when fully developed, form a rosette on the ground. Blades are obovate or oblong obtuse, hairy, large, 5–10 cm by 1.2–3 cm. The petioles are short, hairy, often crowded at the base of stem. Flowers are small and whitish pink.[1–3]

**Origin:** Native to Africa, tropical and temperate Asia and Australasia.[4]

**Phytoconstituents:** Molephantin, crepiside E, deoxyelephantopin, stigmasteryl, stigmasteryl, scabertopin, lupeol and others.[5–9]

**Traditional Medicinal Uses:** In Vietnam, the plant is considered diuretic and administered at parturition.[10] A decoction of whole plant is bechic, used to treat pulmonary disease and scabies. In India, it is used as a tonic, laxative, analgesic, aphrodisiac and to treat inflammation. In the Philippines, the plant is febrifuge, diuretic and emollient.[10] In Malaysia, it is used as a preventive medicine after childbirth, to expel intestinal worms, for coughs and venereal diseases. In Chinese medicine, it is used to cure “dumpheat”, which includes indigestion, swollen legs and loss of appetite.[11] In Indonesia, the plant is prescribed when there is a yellowish discharge from the vagina.[11] The plant is also considered as diuretic, emollient, used for relief of anuria and blennorrhoea,
remedy for leucorrhoea and anaemia, to treat fever, inflammation and as a disinfectant.[6] The whole plant is decocted for abscesses, cold, dysentery, oedema, gastroenteritis, gonorrhoea, influenza, pharyngitis and snakebite.[11] In Burma, a decoction of the stem and leaves is used in cases of menstrual disorders.[10] The roots are used for fever in children, on pimples, wounds of cattle, as an abortifacient, for urinary complaints, amoebic dysentery and other digestive problems.[12]

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** Molephantin isolated from plant demonstrated cytotoxic activity.[5]

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
30. *Euphorbia hirta* L. (Euphorbiaceae)

Asthma Weed

**Description:** *Euphorbia hirta* L. is an annual herb, which can grow up to 30 cm tall, and branched near the base. Leaves are elliptic-oblong, 2–3 cm by 0.8–1.5 cm. Inflorescence is small, in axillary dense clusters, each with one female flower and 4–5 male flowers inside.[1]

**Origin:** Native to the Pantropic.[2]

**Phytoconstituents:** Euphorbon, euphasterol, camphol, leucocyanidol, xanthorhamnin, taraxerol, taraxerone, myricitrin, euphorbianin and others.[3–6]

**Traditional Medicinal Uses:** The whole plant is decocted for athlete’s foot, dysentery, enteritis, fever, gas, itch, and skin conditions.[3] It is also regarded as anodyne, depurative, diuretic, lactagogue, purgative, and vermifuge. The plant is used for asthma, bronchitis, calculus, colic, cough, dyspnoea,
eruptions, excrescences, influenza, fractures, gonorrhoea, headache, hypertension, measles, nausea, ophthalmia, sores, splinters, stomachache, tumours, urogenital ailments, warts and wounds. In Central Province of Papua New Guinea, the plant is boiled and the solution is taken by patients who pass blood in the urine. The Chinese use the plant to treat fever, dysentery and skin conditions. In the Philippines and Indonesia, the plant is used to treat bowel problems. The latex is used on warts and abscesses.

**Pharmacological Activities:** Analgesic, Antibacterial, Anti-diarrhoeal, Anti-inflammatory, Anti-platelet, Antiprotozoal, Antipyretic, Anxiolytic, Diuretic, Sedative, Antianaphylactic and Molluscicidal.

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** Toxic to brine shrimp.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
31. *Eurycoma longifolia* Jack (Simaroubaceae)

Tongkat Ali, Ali’s Umbrella, Pasak Bumi

**Description:** *Eurycoma longifolia* Jack is a small tree with compound leaves on branches that can grow up to 1 m long. The numerous leaflets are opposite or subopposite, lanceolate to ovate-lanceolate, 5–20 cm by 1.5–6 cm, with smooth margins. Flowers are tiny, reddish, unisexual and are densely
The drupes are ovoid with a distinct ridge, 1–2 cm by 0.5–1.2 cm and they turn dark reddish brown when ripe.[1–3] **Origin:** Native to Malesia and Indochina.[4]

**Phytoconstituents:** Eurycomalactone, eurycomanol, eurycomanone, eurylecetin, eurycone, laurycolactone A and B, longilactone, pasakbumin A to D, eurycomalide A and B, piscidinol A and others.[3,5–19]

**Traditional Medicinal Uses:** The plant is used to cure indigestion and lumbago. It is used as a tonic after childbirth, to relieve pains in the bone and for treatment of jaundice, dropsy, cachexia and fever.[5,20] Tongkat Ali is one of the most well known folk medicines for intermittent fever (malaria) in Southeast Asia.[16] Decoction of the leaves is used for washing itches, while the fruits are used in curing dysentery.[3] Its bark is used as a vermifuge.[3] The taproots are used to lower high blood pressure, while the root bark is used for the treatment of fever and diarrhoea.[18] The roots of this plant are used as folk medicine for the treatment of sexual insufficiency, aches, persistent fever, malaria, dysentery, glandular swelling and also as health supplements.[18]

**Dosage:** 1 g daily is recommended to be the maximum dose for supplemental use.[39]

**Adverse Reactions:** No information as yet.

**Toxicity:** One animal study found that the LD₅₀ in mice was 1500–2000 mg/kg of the alcohol extract and 3000 mg/kg of the water extract. A subacute toxicity study with the alcohol extract indicated that 600 mg/kg daily was associated with signs of toxicity while 200 mg/kg daily was not, and another study found no toxic effects at 270–350 mg/kg daily but toxic effects were observed at 430 mg/kg daily.[39] Eurycomanone was identified as the most toxic component from its butanol extract.[40]

**Contraindications:** Should be used with caution and preferably not for extended periods without taking periodic breaks from use when it is used as a supplement. Tongkat Ali should not be taken by methods other than oral administration.[39]

**Drug-Herb Interactions:** No information as yet.
32. **Hibiscus mutabilis** L. (*Malvaceae*)

Cotton Rose, Chinese Rose

**Description:** Hibiscus mutabilis L. is a small tree that can grow up to 5 m tall. Leaf blades are heart-shaped, broadly ovate to round-ovate or cordate, 5–7-lobed, 10–15 cm in diameter, and papery. Abaxially, they are densely stellate and minutely tomentose; adaxially they are, sparsely stellate and minutely hairytoothed, 8–15 cm wide. Flowers are solitary and with multi-petals, white colour in the morning, changing to pink in the afternoon.\(^{[1–3]}\)

**Origin:** Native to China.\(^{[4]}\)

**Phytoconstituents:** Isoquercitrin, hyperoside, rutin, quercetin, naringenin, tetracosanoic acid, daucosterol, salicylic acid, quercimeritrin, meratrin and others.\(^{[5–10]}\)

**Traditional Medicinal Uses:** The plant is used for fistulae, pustules and tumours.\(^{[11]}\) The leaves and flowers are used as an analgesic, to expel phlegm,
treat excessive bleeding during menstruation, painful urination, inflammation and snake bites.\cite{3} The leaves and flowers are also used as demulcent, diuretic and treat bacterial infection. They are used to treat boils, particularly on the chin, in the form of a poultice made of powdered dried leaves and flowers mixed with concentrated tea infusion which makes the boils burst earlier and less painfully. They are also used for treating impetigo, prurigo, metritis, leucorrhoea, mastitis, nephritis, cystitis, dysuria and infections.\cite{12} The leaf is applied to swellings, crushed and compressed and applied onto abscesses, burns, and ulcers. It is also used as anodyne, alexipharmic, demulcent, expectorant, and refrigerant.\cite{11} The flowers are used for lung ailments, with leaves for burns, inflammation, and snake bite. They are also prescribed for cough, dysuria and menorrhagia.\cite{11}

**Pharmacological Activities:** Anti-inflammatory.\cite{13}

**Dosage:** For the treatment of impetigo, prurigo, metritis, leucorrhoea, mastitis, nephritis, cystitis, dysuria and infections, a dose of 5 to 20 g of leaves and flowers is taken daily in the form of a decoction.\cite{12}

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
33. **Hibiscus rosa-sinensis** L. (Malvaceae)

Hawaiian Hibiscus, China Rose, Bunga Raya

**Description:** Hibiscus rosa-sinensis L. is a small evergreen perennial tree that can grow up to 3.6 m tall. It produces flower all year round. The large glossy leaves are ovate, alternate and vary in colour from pale green to dark green, with serrated edges. The flowers have five petals, and their colour varies but are mostly red.[1,2]

**Origin:** Native to South Eastern Asia and cultivated throughout the world as decorative plants.[3]

**Phytoconstituents:** Gossypetin, anthocyanin, myristic acid, palmitic acid, ambrettolide, campesterol, methyl stearate, malvalate and others.[4-6]

**Traditional Medicinal Uses:** In Suquang, Papua New Guinea, the whole plant juice is applied directly to sores, to treat headaches and irregular
periods. In Central Province, the plant is used to treat eye sores whereas in Northern Province and North Solomons Province, it is used to induce labour. In Indonesia, it is used as a purgative, an abortifacient and to regulate menstruation. The juice also provides a soothing effect on mucous membrane that line the respiratory and digestive tracts. The flowers and leaves are used to treat skin diseases, mumps, to relieve fever, as well as to be used as emollient, anodyne and laxative. The flower is also used as an astringent for excessive menstruation, fever and skin diseases. Its roots are used to treat gonorrhoea. In Finschhafen, the roots and leaves are crushed and the juice is drunk to treat diarrhoea.

**Pharmacological Activities:** Antianxiety, Anticancer, Anticonvulsant, Antifertility, Antioxidant, Hepatoprotective, Hypoglycaemic, Hypolipidaemic and Wound healing.

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** Not to be taken by small children, and during pregnancy and lactation.

**Drug-Herb Interactions:** No information as yet.
34. **Hibiscus tiliaceus** L. (Malvaceae)

**Linden Hibiscus, Sea Hibiscus, Mahoe**

**Description:** *Hibiscus tiliaceus* L. is an evergreen coastal tree that can grow up to 10 m tall. Leaves are heart-shaped, 10–15 cm long and wide, leathery and green. The large showy flowers are yellow with maroon centre. Fruit is capsular, subglobose to ovoid, about 2–3 cm long and wide, surrounded by the calyx. Seeds are reniform, smooth and glabrous.[1–4]

**Origin:** Native to the Pantropic.[4]

**Phytoconstituents:** Hibiscones A–D, hibiscusin, hibiscusamide, friedelin, epifriedelanol, pachysandiol A and others.[2,5–7]

**Traditional Medicinal Uses:** In Malaysia and Indonesia, the leaves are considered cooling and are used to treat fever. They are also used as a soothing agent and to remove phlegm from the respiratory passages.[2] The flowers are widely used as a means of birth control in traditional medicine in Asian and African countries.[8] In the Philippines, the mucilaginous water obtained by soaking the fresh bark in water is prescribed for dysentery[2] while the root is an ingredient of embrocations and is used as a febrifuge.[8]

**Pharmacological Activities:** Tyrosinase inhibitory,[9] Antioxidant[10,11] and Cytotoxic.[5]

**Dosage:** No information as yet.
Adverse Reactions: No information as yet.
Toxicity: No information as yet.
Contraindications: No information as yet.
Drug-Herb Interactions: No information as yet.
35. Impatiens balsamina L. (Balsaminaceae)

Balsam Plant

Description: Impatiens balsamina L. is an annual, erect, succulent plant, which is about 30–90 cm tall. Leaves are simple, alternate, 15 cm long, serrated and arranged spirally. Flowers are white, pink, purple or variegated and usually in leaf axils. Fruits are capsular, tomentose and contain several seeds.[1–5]

Origin: Native to India.[5]

Phytoconstituents: Impatienol, pelargonidine, delphinidine, cyanidine, balsaminones A and B, hosenkosides F–O and others.[4,6–10]

Traditional Medicinal Uses: A lotion of fresh leaves is used to treat eczema, itches and insect bites.[4] In Vietnam, decoctions of leaves are used to stimulate growth and to wash hair.[4] The juice is also used for warts, cancer treatment and expectorant.[11] A decoction of flowers is taken for infections,
vomiting, urine retention and as a tonic. In India, flowers are regarded as cooling, tonic and useful when applied to burns and scalds.[4] The flowers are also used for lumbago and intercostal neuralgia, snakebite, improves circulation and relieves stasis.[13] In Japan, juice squeezed from the white flower petals are applied on the skin to alleviate dermatitis.[6] In China, the seeds are prescribed for difficult labour, puerperal pains, difficult menstruation, cough, hicups and poisonings. The seeds are mixed with arsenious acid for removing teeth.[4] In Malaysia, the seeds are taken for gastrointestinal tract cancer, and to dislodge fish or chicken bones in throat.[4]

Dosage: No information as yet.

Adverse Reactions: No information as yet.

Toxicity: No information as yet.

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
36. **Imperata cylindrica** (L.) P. Beauv. (Gramineae)

Lalang, A lang-alang, Speargrass
Description: Imperata cylindrica (L.) P. Beauv. is a perennial erect grass about 0.6–1.5 m tall. Leaf blades are linear to lanceolate, long, 0.5–1 cm by 15–30 cm, narrow, with sharp margins and prominent nerves. Inflorescences are white and fluffy. Rhizome is hard, coriaceous and deep within the soil.[1]

Origin: Native to China and Africa but this widespread weed can be found throughout the world.[2]

Phytoconstituents: Arborinione, arundoin, anemonin, isoorientin, imperanene, cylindol A and B, graminones A and B, cylindrene, isoarborinol, impecyloside and others.[3–10]

Traditional Medicinal Uses: Rotted grass from thatch boiled with wine is used to treat bug bite, haemoptysis, severe constipation and vaginismus. It is also used for drug withdrawal symptoms.[3] Besides being used to quench thirst, its flowers and rhizome are also used to treat blood in the sputum, nose bleeds, lung and kidney diseases, jaundice,[11] haemorrhage, wounds, haemoptysis, epistaxis, haematemesis, haematuria, nephritic oedema, high fever, and urinary tract infections.[3] The roots are used to treat fever, cough with phlegm,[11] asthma, cancer, dropsy, epistaxis, haematuria, jaundice, nephritis, diarrhoea, gonorrhoea[3] and dysuria.[12]

Dosage: Rhizome is used for the treatment of urodynia, pollakiuria, haematuria and fever. The recommended usual daily dose is 10 to 40 g in the form of a decoction, to be administered orally.[1]

Adverse Reactions: Allergic contact dermatitis[14] and sensitivity to grass pollen (Type I allergy).[15]

Toxicity: No information as yet.

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
37. *Ipomoea pes-caprae* (L.) Sweet (Convolvulaceae)

Beach Morning Glory, Goat’s Foot Creeper, Bayhops

**Description:** *Ipomoea pes-caprae* (L.) Sweet is a seaside trailing herb. The stems are long and the roots are found at the nodes. Leaves are simple, ovate, quadrangular or rounded, 2.5 cm by 10 cm, with slender petioles. Cymes are 1–3 flowered; the 5 sepals are ovate and blunt. The flower funnel is about 3–5 cm long. The plant bears dehiscent capsules (1.2 cm) containing hairy seeds that break up easily.[1–4]

**Origin:** Native to the Pantropic.[5]

**Phytoconstituents:** Pescaprise A & B, pescapreins I–IX, stoloniferin III, E-phytol, β-damascenone and others.[6–12]

**Traditional Medicinal Uses:** The juice squeezed from the plant is used by the Malays to treat fish stings.[3] In Burma, infusions of the plant with rusted iron are used to cure gynaecologic haemorrhages.[4] In India, the plant is known to be cooling, astringent and laxative. It is used internally as an emollient in Vietnam.[6,13] The plant has also been administered for headache.[14] In Thailand, it is used to treat dermatitis caused by jellyfish (e.g., Portuguese man-of-war).[15] The leaves are used in Indonesia to hasten the bursting of boils and used externally for injured feet. Sap from the young leaves are boiled in coconut oil and used to treat sores and ulcers. In the Philippines, the
boiled leaves are used to treat rheumatism and fungal infection. In Papua New Guinea, decoctions of the leaves are applied to sores. On the Solomon Islands, preparations of the leaves are ingested for digestive troubles. The seeds are chewed with areca nut to soothe abdominal pains and cramps or consumed alone as a purgative. Decoctions of the tubers are also ingested to treat bladder problems.

**Pharmacological Activities:** Analgesic, Antidiabetic, Anti-inflammatory, Antiplatelet aggregation, Antiviral, Antivenom, Collagenase inhibitory activity, Muscle relaxant and Prostaglandin synthesis inhibition.

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
38. **Ixora chinensis** Lam. (Rubiaceae)

**Chinese Ixora**

**Description:** *Ixora chinensis* Lam. is a small, dense shrub that can grow up to 2 m tall. Leaves are short-stalked, obovate-obleng, waxy, 6–10 cm long. Flowers are densely arranged, with 4 petals in bright red.[1]

**Origin:** This common garden flower is native to China and Thailand.[1]

**Phytoconstituents:** Ixoronic acid, ixoroside, ixoside, geniposidic acid and others.[2–4]

**Traditional Medicinal Uses:** It is used for hypertension.[5] The whole plant is used to treat rheumatism, abscesses, bruises, and wounds. It is also used as an anodyne, and resolvent. It is beneficial to bone marrow and pregnant uterus as well.[6,7]

**Pharmacological Activities:** No information as yet.

**Dosage:** No information as yet.
A Guide to Medicinal Plants

**Adverse Reactions:** No information as yet.
**Toxicity:** No information as yet.
**Contraindications:** No information as yet.
**Drug-Herb Interactions:** No information as yet.
39. **Jatropha curcas** L. (Euphorbiaceae)

**Barbados Nut, Physic-nut**

**Description:** *Jatropha curcas* L. is a woody shrub, 2–5 m tall. Stems are smooth and leaves are ovate, 5–15 cm long, green and glabrous. The blade is thin and 5-lobed-cordate. The flowers are 6 mm by 7 mm, hermaphrodite, and with fragrance. Fruit is 3-lobed fleshy capsule of about 2.5 cm in length, containing black seeds.\(^{[1,2]}\)

**Origin:** Native to Mexico,\(^{[2]}\) widely cultivated and naturalised in New and Old World Tropics.\(^{[3]}\)

**Phytoconstituents:** Curcain, curcasin, curcacycline A, jatropholone A and B, heudelotinone, nobiletin, jatrocurin, curcin, curcusone B and others.\(^{[4–14]}\)
Traditional Medicinal Uses: The leaves are used to treat scabies, parasites and as a rubefacient for paralysis and rheumatism. The seed oil is emetic, laxative, purgative and for skin ailments. The latex is applied to bee and wasp stings, to dress ulcers, sores and inflamed tongues. It is also used as a haemostatic agent and to treat whitlow, carbuncle and sores in mouth. The roots are used in the form of a decoction as mouthwash for bleeding gums and toothache.

Dosage: Two seeds have been used as a purgative.

Adverse Reactions: No information as yet.

Toxicity: Human poisoning may lead to amnesia, convulsions, delirium, diarrhoea, nausea, vertigo, visual disturbances, acute abdominal pain, nausea, depression and collapse may also occur. Intake of 4–5 seeds may cause death. It is toxic to rats, chicks and human.

Contraindications: No information as yet.

Drug-Herb Interactions: May have interactions with other drugs that are metabolised by cytochrome P450 enzymes.

[Authors’ Note: Jatropha curcas is also cultivated as a source of biofuel.]
**Juniperus chinensis** L. (Cupressaceae)

**Chinese Juniper**

**Description:** *Juniperus chinensis* L. is conical shaped tree that can grow up to 25 m tall. Leaves are both scale-like and needle-like. Needle-like leaves are present on both young and adult plants, decussate or in whorls of three, loosely arranged, ascending, nearly lanceolate whereby scale-like leaves are present only in the adult. Seed cones are brown when ripe, usually glaucous, subglobose and 4–9 mm in diameter.\(^1\)

**Origin:** Native to Myanmar and temperate Asia.\(^2\)

**Phytoconstituents:** Chinensiol, yatein, podophyllotoxin, thujopsenal, widdrol, sandaracopimmaric acid, hinokiic acid and others.\(^3\)-\(^{11}\)
**Traditional Medicinal Uses:** The leaves are used as a tonic to treat bleeding resulting from coughs.\(^{[12]}\) It is also used for cold and haemorrhage. Liquor brewed from fresh leaves is used as a tonic and to treat hemoptysis. Others include treatment for convulsions, excessive sweating and hepatitis.\(^{[3]}\) Its roots are used on burns, scalds and to promote hair growth on scars.\(^{[3]}\)

**Pharmacological Activities:** Antibacterial,\(^{[13]}\) Antifungal,\(^{[13,14]}\) Anti-neoplastic,\(^{[15]}\) Antioxidant,\(^{[6]}\) Hypoglycemic\(^{[16]}\) and Hypolipidaemic.\(^{[8,16]}\)

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
41. *Kaempferia galanga* L. (Zingiberaceae)

Galangal, Sand Ginger, Kencur

**Description:** *Kaempferia galanga* L. is a small herb with short underground stems. Leaves are usually in pairs, oval, glabrous, pointed, 6–15 cm long, and spread out above ground with prominent veins. Flowers are in short stalked spikes. The corolla is white or pinkish, with violet spotted lip.[1]

**Origin:** Native to tropical Asia.[2]

**Phytoconstituents:** Ethyl cinnamate, 1,8-cineole, δ-3-carene, α-pinene, camphene, borneol, cyene, α-terpineol, α-gurjunene, germacres, cadinenes, caryophyllenes and others.[3–8]
Traditional Medicinal Uses: The whole plant is used as a postpartum protective medicine, treatment for stomachache, diarrhoea, dysentery, treatment for rheumatism, swellings, fever, coughs, asthma and as a tonic/lotion.\[8\] In Malaysia, the leaves and rhizomes are chewed to stop cough. In Indonesia, it is used for abdominal pain, for swelling and muscular rheumatism. In the Philippines, the rhizome is used for boils, chillis, dyspepsia, headache and malaria. The Indians also use the rhizomes as lotions, poultices for fever, rheumatism, sore eyes, sore throat and swellings.\[3\] The rhizomes are stimulant, used to treat toothache, chest pains and constipation.\[9\] They are also used as carminative, prophylactic, stomachic, for dandruff and scabs. A decoction of the rhizome is used for cholera, contusion, dyspepsia, headache, lameness, lumbago, and malaria. It is also roasted and applied to rheumatism and tumours.\[3\] To facilitate delivery during birth, it is mixed with the juice of Curcuma montana, C. aromatica and ginger rhizomes and consumed.\[10\]

Pharmacological Activities: Antibacterial,\[11,12\] Antifungal,\[13\] Antihypertensive,\[14\] Anti-inflammatory,\[8\] Antineoplastic,\[15-18\] Antioxidant,\[19\] Antiprotozoal,\[20\] Depressant,\[21\] Immunomodulatory,\[21\] Vasorelaxant,\[22\] Antiallergy,\[23\] Insect repellent,\[24,25\] Insecticidal\[25-28\] and Wound healing.\[29\]

Dosage: Oral doses range from 3 to 6 g of the rhizome per day, administered in the form of decoction, powder or pill for the treatment of pectoral and abdominal pains, headache, toothache and cold.\[30\]

Adverse Reactions: No information as yet.

Toxicity: The ethanolic extract injected intraperitoneally in increasing doses of 25, 100, 250 and 800 mg/kg body weight resulted in a decrease in motor activity, respiratory rate, loss of screen grip and analgesia in rats. A dose of 2000 mg/kg body weight was observed to be lethal. A cute and subacute oral toxicity test of Kaempferia galanga produced neither mortality nor significant differences in the body and organ weights between controls and treated rats.\[21\]

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
42. *Lantana camara* L. (Verbenaceae)

Common Lantana, Bunga Tahi Ayam, Wild Sage

*Description:* *Lantana camara* L. is a small shrub with long, weak branches. Leaves are opposite, ovate, 5–12 cm long with a pungent scent. Flowers are in dense spikes, with salver-shaped corolla, 1–1.2 cm long, orange, red, pink or variegated. Fruit is bluish, globose and 4 mm in diameter.[1]

*Origin:* Native to Mexico and Southern America.[2]

*Phytoconstituents:* Lantadene A and B, lantanolic acid, lantanilic acid, icterogenin, lantanose A & B, lamiridoside, geniposide, δ-guaiene, camarinic acid and others.[3–14]

*Traditional Medicinal Uses:* The whole plant is used as a bath for scabies and leprosy.[3,15] The entire plant is also a carminative, diaphoretic, vulnerary, used for fistulae, pustules, tumours, treating malaria, rheumatism, tetanus and spasms.[3] In Budiope county, Uganda, the leaves are used for treating malaria.[16] The root and leaves are decocted to treat fever, mumps, neurodermatitis and traumatic injuries.[3,16]

Dosage: No information as yet.

Adverse Reactions: No information as yet.

Toxicity: Ingestion of green berries had been reported to cause human fatalities.[43] L. camara is harmful to animals[44–58] and causes teratogenicity in rats.[59]

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
**43. *Lonicera japonica* Thunb. (Caprifoliaceae)**

*Japanese Honeysuckle, Jin Yin Hua*

**Description:** *Lonicera japonica* Thunb. is a climbing shrub having tomentose young leaves and stems. Leaves are simple, opposite and exstipulate. Blade is elliptic, 3–8 cm by 2–3 cm, truncate at base, obtuse and chartaceous. Flowers are axillary, white, and turns yellow upon maturity. Fruits are globose and black.[1]

**Origin:** A native of East Asia, widely cultivated and naturalised throughout the world.[2]

**Phytoconstituents:** Linalool, luteolin, geraniol, aromadendrene, eugenol, loniceroside A, B, C, L-phenylalaninosecologanin, (Z)-aldosecologanin, (E)-aldosecologanin and others.[3–8]

**Traditional Medicinal Uses:** In China, the flowers are used for influenza, boils and carbuncle.[3] In Malaysia, decoctions of dried flowers are used for cooling, flu, fever, headache, and boils. Distilled flowers are used to produce
A Guide to Medicinal Plants

Flower tea is prescribed to treat fever, sore throat, mouth sores, headache, conjunctivitis, keratitis, corneal ulcers, breast infections, muscle and joint pain, stomach problems, diarrhoea, and painful urination. They are used in the treatment of arthritis and inflammation. Flower buds are used in infusions for cutaneous infections, scabies, as diuretic and to treat bacterial infection. Decoction is used for bacterial dysentery, cold, enteritis, infected boils, laryngitis, lymphadenitis, rheumatism and sores. The flowers and stems are regarded as cooling and are used to treat aching bones and boils. Other uses include intestinal inflammation, stomach ulcers, painful haemorrhoids, sore throats and intoxication.

**Pharmacological Activities:** Antibacterial, Anticancer/Antineoplastic, Antifungal, Antihypertensive, Anti-inflammatory, Antioxidant, Antiplatelet, Antiviral, Hepatoprotective and Antiatherogenic.

**Dosage:** In China, 10–60 g of dried floral buds are used for decoction. A combination of 10 g of honeysuckle, 10 g of forsythia, a little mint and bamboo leaf is a prescription for a bad cold from a drugstore in China. About 9–15 g dried flowers has been used in decoction, pills, powder or poultice of the powder. The recommended daily dose is 4 to 8 g of flowers or 10 to 20 g of stems and leaves in the form of a decoction, infusion, extract or alcoholic maceration for the treatment of boils, impetigo, urticaria, allergic rhinitis, fever, malaria, erythema, measles, diarrhoea, dysentery, syphilis, rheumatism and lichen tropicus. For carbuncles, boils, erysipelas, acute dysentery, pharyngitis, upper respiratory infection and epidemic febrile diseases, 6–15 g of dried flowers are used.

**Adverse Reactions:** Linear, itchy, raised blisters on the skin may occur on contact.

**Toxicity:** No sign of acute and subacute toxicity was observed.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
44. *Mangifera indica* L. (Anacardiaceae)

Mango, Mangga

**Description:** *Mangifera indica* L. is a fruit tree which grows up to 8 m high. Bark is grey and fissured. Leaves are simple, 12–30 cm by 4–9 cm, narrowly elliptic, pointed, and slightly leathery with wavy edges. Flowers are very small, greenish-yellow or white, fragrant and arranged in panicles. The fruit is kidney-shaped and the yellow to orange flesh is edible. Seed is elongated, fibrous and flattened.[1]

**Origin:** Native to India and Indochina.[2]

**Phytoconstituents:** Mangiferin, ambolic acid, ambonic acid, arabinan, mangiferonic acid, quercitin, violaxanthin and others.[3–7]

**Traditional Medicinal Uses:** The leaves are used in the form of ashes for burns and scalds; chewed to strengthen the gums, while the burning leaf smoke is inhaled for hiccups and other throat ailments. They are also used for skin ailments, asthma and cough.[4] Paste of leaves is applied to warts and used as styptic ointments.[5] The leaves are also used in the treatment of malaria in Budiope county, Uganda.[6] The fruits are used to treat pain in abdomen, diarrhoea, and to quench thirst (with Aegle and salt).[9] Pulp of the
fruit is used in China to promote blood circulation, the fruit rind as tonic in Burma and dried slices of young fruits are used for septicaemia in Palau. Its seeds are used for stubborn colds, coughs, diarrhoea, vermifuge and menorrhagia. They are also used for asthma. In the Philippines, raw seeds are used to expel worms and the roasted ones are for diarrhoea. The bark is used for the treatment of fever or sunstroke, cholera, rheumatism, sty in eye, ulcerated tongue (with roots of Ichnocarpus and bark of Zizyphus rugosa), haemiplegia, diarrhoea (with bark of Streblus asper, roots of Oroxylum indicum and Helianthus annuus), dysentery (with bark of Streblus and Spondias pinnata), poisoning, uterine haemorrhage and jaundice.

**Pharmacological Activities:** Analgesic, Anthelmintic, Antibacterial, Anticonvulsant, Antidiarrhoeal, Antifungal, Anti-inflammatory, Anticancer, Antioxidant, Antiviral, Gastroprotective, Hypoglycaemic, Hypolipidaemic, Immunomodulatory, Larvicidal and Radioprotective.

**Dosage:** As an anthelmintic, it is recommended to take 20–30 g of powdered seed.

**Adverse Reactions:** A naphylactic reaction following ingestion of fruit.

**Toxicity:** Intraperitoneal LD₅₀ (50% ethanolic extract) is > 1000 mg/kg in mice.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** Modulation of P450 isozymes.
45. *Manihot esculenta* Crantz (Euphorbiaceae)

Tapioca, Cassava

**Description:** *Manihot esculenta* Crantz is an erect woody shrub that can grow up to 5 m tall. Leaf blades are palmately 3–9-lobed, 5–20 cm. Lobes are oblanceolate to narrowly elliptic, entire, 8–18 cm by 1.5–4 cm. Root tubers beneath the ground yield tapioca, which is fleshy, starchy and edible.[1,2]

**Origin:** Native to Brazil, cultivated throughout the tropics.[2]

**Phytoconstituents:** Linamarin, escultentoic acid A and B, esculentin, esculin, scopoletin, scopolin, oxalic acid, saponins and others.[3–8]

**Traditional Medicinal Uses:** Rhizome is made into a poultice and applied to sores.[5]

**Dosage:** No information as yet.
**Adverse Reactions:** Several minor acute intoxications were seen, with complaints of nausea, vomiting, abdominal pain and headache following a meal of cassava.\[12\]

**Toxicity:** Hydrocyanic acid — oral, human LD$_{50}$ 570 µg/kg; Oxalic acid — oral, human LD$_{50}$ 700 mg/kg; Saponin — oral, mouse LD$_{50}$ 3000 mg/kg; Tryptophane — oral, rat TD$_{50}$ 1100 mg/kg. Bitter cassava juice can cause death due to cyanide poisoning.\[5\] Haemorrhage, necrosis, fibrosis and atrophy of the acinar tissue and fibrosis of the islets of Langerhans of the pancreas occurred in dogs fed on cassava.\[13\] Epidemic spastic paraparesis (konzo) is known to be due to long-term intake of cassava (M. esculenta).\[10\] Tropical atactic neuropathy, a polyneuropathy with sensorineural hearing loss and optic atrophy can also result from intake of cassava in humans.\[14\]

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** Co-administration of cassava rich diet and alcohol is found to reduce the alcohol induced toxicity in rats.\[7\]
46. *Melaleuca cajuputi* Roxb. (Myrtaceae)

Gelam, Paper-bark Tree, Kayu Puteh

*Description:* *Melaleuca cajuputi* Roxb. is a medium sized tree with an often twisted trunk when the tree is very old. Bark is light brown, flaky and peeling. Leaves are simple, slightly curved, with 5–7 longitudinal veins. Flowers are white and borne in dense spikes. Seeds are borne in a capsule.\(^{[1-3]}\)
Origin: Native to tropical Asia and Australasia.\[^4\]

Phytoconstituents: Cajeputol, cineole, \(\beta\)-pinene, eugenol, phellandrene, \(\alpha\)-terpineol, eugenetin, isoeugenetin and others.\[^2,5,6\]

Traditional Medicinal Uses: In Malaysia, it is used for the treatment of colic and cholera. It is also used externally for thrush, vaginal infection, acne, athlete’s foot, verruca, warts, insect bites, cold sore and nits.\[^5\] Cajuput oil is distilled from the leaves and used by the Burmese to treat gout. The Indochinese uses cajeput oil for rheumatism and pain in the joints and as an analgesic.\[^2\] The oil is used externally in Indonesia for burns, colic, cramps, earache, headache, skin diseases, toothache and wounds. When administered internally, it can induce sweating and act as a stimulant and antispasmodic. In the Philippines, the leaves are used to treat asthma.\[^2,6\]

Pharmacological Activities: Antibacterial.\[^5\]

Dosage: For treatment of coryza, influenza, cough, asthma, dyspepsia, earache, toothache, rheumatism, osteodynia, neuralgia, wounds, burns, post partum haematometra. The reported dose for the above ailments is 20 to 40 g of fresh leaves or 5 to 10 g of dried leaves in the form of a decoction or infusion.\[^7\]

Adverse Reactions: Contact dermatitis may occur. Glottal spasms or bronchial spasms or asthma-like attacks may occur if the oil is applied to the facial areas of infants and small children.\[^8\]

Toxicity: Due to the high cineole content, life-threatening poisonings can occur with overdoses of cajuput oil (more than 10 g). Symptoms of poisoning are reduction in blood pressure, circulatory disorders, collapse and respiratory failure.\[^8\]

Contraindications: Do not consume orally in severe liver diseases and presence of inflammatory condition of gastrointestinal tract or of the biliary ducts. Cajuput oil preparations are not to be applied to the faces of infants or small children.\[^8\]

Drug-Herb Interactions: No information as yet.
47. *Melastoma malabathricum* L. (Melastomaceae)

Sendudok, Singapore Rhododendron

**Description:** *Melastoma malabathricum* L. is a small shrub that can grow up to 1 m tall, densely clothed with tiny scales. Leaves are simple, ovate, elliptic, 4–14 cm by 1.7–3.5 cm, and stiffly papery. Flowers are purple with five petals and fruits are urceolate-globular, 6–15 mm by 6–12 mm and succulent.[1,2]

**Origin:** Native to tropical and temperate Asia and the Pacific Islands.[2]

**Phytoconstituents:** Malabathrins A–F, nobotanins B, G, H and J, kaempferol and others.[3–9]

**Traditional Medicinal Uses:** In Indonesia and Malaysia, the leaves and roots are used as a remedy for diarrhoea and dysentery. The leaves are also used to
wash ulcers, to treat piles and for small pox pustules to prevent development of scars.\textsuperscript{[10]} Its bark is used to treat skin diseases.\textsuperscript{[11]}

**Pharmacological Activities:** Analgesic,\textsuperscript{[12]} Anti-inflammatory,\textsuperscript{[13]} Antineoplastic,\textsuperscript{[14]} Antinociceptive,\textsuperscript{[13]} Antiviral,\textsuperscript{[14,15]} Antioxidant\textsuperscript{[15]} and Antiplatelet.\textsuperscript{[16]}

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** \textit{M. malabathricum} was reported to be an aluminium (Al) accumulator (with up to 10 g Al/kg of dry weight in old leaves and up to 7 g Al/kg dry weight in new leaves) and could lead to accumulation of aluminium in the bone and brain, leading to neurotoxicity, when consumed in large amount.\textsuperscript{[17]}

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
48. *Mimosa pudica* L. (Leguminosae)

Touch-me-not, Sensitive Plant, Rumput Simalu

**Description:** *Mimosa pudica* L. is a prickly, herbaceous weed. Leaves bipinnate, very sensitive, fold together when touched, in rain or at night. Leaflets are 15–20 pairs, small oblong, nearly sessile. Flowers are pink and fruits are flat pods covered with bristles. [1–3]

**Origin:** Native to Brazil. [3]

**Phytoconstituents:** Mimosine, 2-Hydroxymethyl-chroman-4-one and others. [4–6]

**Traditional Medicinal Uses:** The plant is used on cuts and wounds. [4,7] It is also used for childbirth and infertility in Trinidad and Tobago. [8] Bath with plant decoction relieves insomnia. [4] The leaves are used for hydrocele, dressing for sinus, sores, piles and swelling of feet. In Mexico, aqueous extracts
from dried leaves are employed to alleviate depression. In the Philippines, the leaves soaked in coconut oil is used for ulcers.

**Pharmacological Activities:** Anthelmintic, Antibacterial, Anticonvulsant, Antidepressant, Antifertility, Antifungal, Hyperglycaemic, Antioestrogenic and Antivenom.

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
49. *Mirabilis jalapa* L. (Nyctaginaceae)

Four O’Clock Flower, Bunga Pukul Empat

Description: *Mirabilis jalapa* L. is an erect herb that can grow up to 1 m tall. Leaves are simple, heart-shaped, 3–12 cm long, opposite, tapering to a pointed end. Flowers are bisexual, red, pink, yellow or white, with perianth distinctly constricted above, and they bloom late in the afternoon. Fruits are black and globose, 5–8 mm in diameter.[1,2]

Origin: Native to tropical America, introduced in China and in many tropical areas.[2]

Phytoconstituents: Trigonellin, 2′-O-methylabronisoflavone, 6-methoxyboeravinone C and betaxanthins.[3,4]

Traditional Medicinal Uses: Its leaves are used as a decoction for abscesses, juice for wounds and cooked with pork as tonic.[5] The leaves are also placed
on boils, blisters, and to relieve urticaria. In Indochina, the seeds are used as a purgative. The flowers release a strong odour at night which will stupefy or drive away mosquitoes. The roots are used as a laxative in a decoction, with or without pork, for colds, inflammation and leucorrhea. In Malagasy, Madagascar, they are used to treat intestinal pains. In South Africa, the roots are used as purgative agents.

**Pharmacological Activities:** Antibacterial, Antifungal, Antineoplastic and Abortifacient.

**Dosage:** Approximately 8–10 g of roots are taken as a purgative.

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
50. *Morinda citrifolia* L. (Rubiaceae)

*Mengkudu, Indian Mulberry, Noni*

**Description:** *Morinda citrifolia* L. is a tree that grows up to 9 m. Leaves are simple, large, 10–15 cm by 20–30 cm, decussate and stipulate. Blade is broadly elliptic to obovate, glossy, soft and succulent. Flowers are small, sessile, white, 1.5–2 cm across, terminal and axillary. The fruit is succulent, oval, 5–7 cm across, light greyish green and turns yellow upon maturity.[1–5]

**Origin:** Native to tropical and temperate Asia and Australasia.[6]

**Phytoconstituents:** Morintrifolins A and B, morindin, morindone, rubiadin, morindadiol, morindicone, morinaphthalenone and others.[1,4,7–28]

**Traditional Medicinal Uses:** The whole plant is used to treat aching bones and arthritis. In Malaysia, the heated leaves are applied to the chest and abdomen to treat coughs, nausea, colic and enlarged spleen. In Japanese and Chinese medicine, *M. citrifolia* is used to treat fever and as a tonic whereas in Indochina, the fruit is prescribed for lumbago, asthma and dysentery.[1] A decoction of the leaves taken orally is effective for the treatment of fever,
dysentery and diarrhoea. Poultice of fresh leaves can be used to cure furunculosis. The fruit when consumed together with a little salt is stomachic, aperient, and active on dysentery, uterine haemorrhage, cough, coryza, oedema and neuralgia. The root bark has beneficial effects in hypertension, osteodynia and lumbago.\cite{7} The fruit is also used for throat and gum complaints, dysentery and leucorrhoea while the root is used as a cathartic and febrifuge.\cite{29} The processed fruit juice is also in great demand for various ailments such as diabetes, high blood pressure, headaches, heart disease, AIDS, cancers, gastric ulcers, mental depression, senility, poor digestion, atherosclerosis and drug addiction.\cite{30}

**Pharmacological Activities:** Analgesic,\cite{30} Anthelmintic,\cite{30,31} Antiangiogenic,\cite{32} Antibacterial,\cite{11,30,33} Anticancer/Antineoplastic,\cite{34-37} Antitumour,\cite{30} Antihypertensive,\cite{30} Antiviral,\cite{30} Anti-inflammatory,\cite{24,25,38} Antioxidant,\cite{14,16,39-44} Antiprotozoal,\cite{45} Antidiabetic,\cite{26} Sedative/Anxiolytic,\cite{25} Chemopreventive,\cite{24} Insecticidal,\cite{9} Wound healing\cite{46} and Hepatoprotective.\cite{47}

**Dosage:** For treatment of hypertension, osteodynia and lumbago, 10 to 20 g of root bark is prescribed daily as a decoction or alcoholic maceration of torrefied material.\cite{7}

**Adverse Reactions:** Sedation, nausea, vomiting, anorexia, hypersensitivity, hyperkalemia may occur.\cite{48,49}

**Toxicity:** The lyophilised aqueous extract of *M. citrifolia* roots did not exhibit any toxic effects but did show a significant, dose-related, central analgesic activity in the writhing and hotplate tests.\cite{50} Chemical analysis and genotoxicity tests revealed that noni juice does not have a genotoxic potential and that genotoxic anthraquinones do not exist in noni juice.\cite{51} However, according to some, anthraquinones are the most likely hepatotoxic components found in *M. citrifolia*.\cite{52} Hepatitis induced by Noni juice had been reported.\cite{53,54}

**Contraindications:** Should not be used during pregnancy and lactation. Contraindicated in people with hyperkalemia or with hypersensitivity to *M. citrifolia*.\cite{48}

**Drug-Herb Interactions:** No information as yet.
**Description:** *Nelumbo nucifera* Gaertn. is an aquatic plant that grows in shallow waters. Leaves are green, round, 30–60 cm across and with long petiole. Flowers are pink, white or red, 10–30 cm and solitary. Fruits are non-edible and non-fleshy.[1]

**Origin:** Native to tropical and temperate Asia, Australia and Eastern Europe.[2]

**Phytoconstituents:** Nuciferin, nornuciferin, nelumboroside A & B, nelumbosine, dotriacontane, ricinoleic, roemerin, liensinine, neferine, lotusine, liriodenine, asimilobin, pronuciferine and others.[3–8]

**Traditional Medicinal Uses:** The leaves are used to treat sunstroke, diarrhoea, dysentery, fever, dizziness and vomiting of blood.[9] The plant is used as an antidote for mushroom poisoning[9] and for smallpox.[10] In Ayurveda,
the plant is used to treat cholera, diarrhoea, worm infestation, vomiting, exhaustion and intermittent fever.\[^3\] The fruits are used in decoction for agitation, fever, heart and haematemesis while the stamens are used to “purify the heart, permeate the kidneys, strengthen virility, to blacken the hair, for haemoptysis and spermatorrhoea”.\[^10\] They are also used to treat premature ejaculation,\[^9\] as astringent for bleeding,\[^3\] excessive bleeding from the uterus,\[^3\] abdominal cramps, bloody discharges, metrorrhagia, non-expulsion of the amniotic sac,\[^10\] and as cooling agent during cholera.\[^11\] The seeds are believed to promote virility, for leucorrhoea and gonorrhoea.\[^10\] Powdered beans are used in treating digestive disorders, particularly diarrhoea.\[^3\] They are also used as a tonic\[^9\] for enteritis, insomnia, metrorrhagia, neurasthenia, nightmare, spermatorrhoea, splenitis and seminal emissions.\[^10\] The roots are for the treatment of diarrhoea, dysentery, dyspepsia, ringworm and other skin ailments and as a tonic as well.\[^10,11\]

**Pharmacological Activities:** Antianxiety,\[^12\] Antiarrhythmic,\[^13\] Antibacterial,\[^4\] Anticonvulsant,\[^14\] Antidiarrhoeal,\[^15\] Anti-inflammatory,\[^16\] Hepatoprotective,\[^18\] Antioxidant,\[^8,17-20\] Antiplatelet,\[^21\] Antiproliferative,\[^22\] Antipyretic,\[^23,24\] Antiviral,\[^25,26\] Hypoglycaemic,\[^27,28\] Hypolipaemia,\[^29\] Immunomodulatory\[^30\] and Insecticidal.\[^4\]

**Dosage:** A daily dose of 10 to 30 g of the ripe seeds as a decoction or powder is used for the treatment of neurasthenia, spermatorrhoea and metrorrhoea. The pericarps should be removed before using the seeds. Decoctions of 15 to 20 g and 2 to 4 g of dried leaves and seed cores respectively have been used for treating insomnia, haemorrhage and haematemesis. 6 to 12 g of plumules, 5 to 10 g of filaments, or 15 to 30 g of the receptacles in the form of a decoction, are used in the treatment of bloody stools, haematuria, uterine haemorrhage and haematemesis.\[^31\] A daily dose of 5 to 8 g of rhizome or seeds taken by mouth is recommended.\[^32\]

**Adverse Reactions:** Stamen, receptacle, rhizome node, leaf, and embryo can be safely consumed with proper usage.\[^33\] No known side effects with appropriate therapeutic dosages.\[^3\]

**Toxicity:** No information as yet.

**Contraindications:** Seed is contraindicated in constipation and stomach distention.\[^33\]

**Drug-Herb Interactions:** No information as yet.
52. **Nephelium lappaceum** L. (Sapindaceae)  
Rambutan, Hairy Lychee

**Description:** *Nephelium lappaceum* L. is an evergreen tree that can grow up to 10 m tall. Leaves are pinnate, 25–40 cm long, compound with 2–4 pairs of leaflets. Blades are elliptic or obovate, 6–18 cm by 4–7.5 cm, thinly leathery, glabrous, with 7–9 pairs of lateral veins. Flowers are greenish white, fragrant and with no petals. The fruit is hairy, turning from green to red when mature and contains one hard seed.[1–3]

**Origin:** Native to Indonesia, Malaysia, Philippines and Thailand.[3]

**Phytoconstituents:** Type II and III cyanolipids, β-caryophyllene, monoterpene lactones 1 & 2, paullinic acid and others.[4–7]

**Traditional Medicinal Uses:** The fruits are used to treat diarrhoea and fever,[2] and also for the treatment of dysentery and dyspepsia.[8] Its seeds are narcotic[8] and the bark is used to treat disease of the tongue while the roots are used for fever.[2]

**Dosage:** No information as yet.
Adverse Reactions: No information as yet.
Toxicity: No information as yet.
Contraindications: No information as yet.
Drug-Herb Interactions: No information as yet.
53. *Nerium oleander* L. (Apocynaceae)

**Oleander**

*Flowers of Nerium oleander, Nerium oleander shrub*

**Description:** *Nerium oleander* L. is a small shrub up to 2 m high. Leaves are very narrowly elliptic, 5–21 by 1–3.5 cm, dark green, without stipules, leathery and arranged in whorls of three. Flowers are showy and fragrant. Sepals are narrowly triangular to narrowly ovate, 3–10 mm. Corolla is purplish red, pink, white, salmon, or yellow. Fruits consist of cylindrical follicles, 12–23 cm. Seeds are oblong, coma, about 0.9–1.2 cm.\[1,2\]

**Origin:** Native to southern Europe,\[2\] and widely cultivated and naturalised in Asia, Europe and North America.\[1\]

**Phytoconstituents:** Oleandroside, kaneroside, neriaside, nerigoside, neriumoside, neridiginoside, nerizoside, neritaloside, proceragenin, neridieneone A, cardenolides N-1 to N-4 and others.\[3–11\]

**Traditional Medicinal Uses:** The plant is used in Ayurveda to treat scabies, eye disease and haemorrhoids.\[3\] It is used to treat parasitic infection in Calabria (Southern Italy).\[12\] Leaf decoction is used to treat diabetes in
southeastern Morocco. Bark, leaf, flower are used medicinally as a cardiovascular and diuretic.

Pharmacological Activities: Analgesic, Anti-inflammatory, Antibacterial, Anticancer/Antineoplastic, Antifungal, Depressant, Antimitotic, Insecticidal, Larvicidal, Muscle stimulatory and inhibits Nuclear factor-kappa B (NF-κB) activation.

Dosage: No information as yet.

Adverse Reactions: Depression, dizziness, stupor, headache, nausea, vomiting, anorexia, abdominal cramps, spontaneous abortion, hypersensitivity, contact dermatitis, hyperkalemia and tachypnea.

Toxicity: Toxic to humans and animals. The plant contains numerous toxic compounds, many of which can be deadly to people. Ingestion can cause both gastrointestinal and cardiac effects and also affect the central nervous system.

Contraindications: Should not be used during pregnancy and lactation, in children and in persons with hypersensitivity to oleander. Should not be taken internally.

Drug-Herb Interactions: Fatal digitalis toxicity can occur with concurrent usage of cardiac glycosides such as digoxin and digitoxin. Concurrent use of quinidine, calcium salts, saluretics, laxatives or glucocorticids increases efficacy as well as side effects.
54. **Ophiopogon japonicus** Ker-Gawl. (Liliaceae)

Dwarf Lilyturf, Mondo Grass, Mai Men Dong

**Description:** *Ophiopogon japonicus* Ker-Gawl. is an evergreen, stemless, rhizomatous herb. Leaves are sessile, long, 10–50 cm by 2–4 mm, linear, grass-like, 3–7 veined, and have pointed tips. Flowers are either solitary or paired.[1,2]

**Origin:** Native to Japan and Korea.[2]

**Phytoconstituents:** Ophiopogonin D and E, ophiopogonin C’ and D’, bornanol, ophiopogonanone A, C, E and F, ophiopojaponin D and others.[3–9]

**Traditional Medicinal Uses:** The roots are used to cool the body system, as a tonic, purgative, thirst quencher, treatment for sore throat, cough and fever. [10] In China, the roots are also used to treat bronchitis, cold, dysuria, haemoptysis, laryngitis, restlessness, thirst, tuberculosis, stress, as an aphrodisiac,
promoting fertility and memory, also as a sialogogue, to treat cancer and frequently included in polyherbal prescriptions for diabetes mellitus. The Indochinese uses the rhizomes to treat fever and inflammation, as a febrifuge, galactagogue, and also for intestinal, kidney and liver ailments.[3]

**Dosage:** The daily dose of tuberous roots of 6 to 20 g in the form of a decoction, pills or syrup consumed as an expectorant or antitussive.[22]

**Adverse Reactions:** No information as yet.

**Toxicity:** LD$_{50}$ value of O. japonicus in mice was more than 2 g/kg intraperitoneally.[12]

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
55. *Peltophorum pterocarpum* Backer ex K. Heyne (Leguminosae)

Jemerlang Laut, Yellow Flame, Yellow Flamboyant

![Peltophorum pterocarpum tree](image)

![Peltophorum pterocarpum flowers](image)

Fruits of *Peltophorum pterocarpum*
**Description:** Peltophorum pterocarpum Backer ex K. Heyne is a large tree with dome-shaped crown that can grow up to 24 m tall. The main rachis are 15–30 cm long and the pinnae are 6–20 paired with each pinna having 20–30 pairs of oblong leaflets. Flowers are yellow and in large bunches. The tree bears pods which are oblong, 5–10 cm long, flat and thin.[1–3]

**Origin:** Native to Malaysia, Ceylon, the Andamans and North Australia.[3]

**Phytoconstituents:** Rhamnetin, hirusitidin, bergenin and others.[4]

**Traditional Medicinal Uses:** The bark extract is used internally to cure dysentery and externally as a lotion to treat sprains, muscular aches, ulcers, and as an eye lotion, gargle and tooth powder.[2]

**Pharmacological Activities:** Antibacterial[5–7] and Antifungal.[7]

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
56. **Persicaria hydropiper** L. (Polygonaceae)

**Water Pepper, Laksa Plant**

**Description:** Persicaria hydropiper L. is an erect herb that can grow up to 30–50 cm tall. Leaves are oblong-lanceolate, short petioled, tapering to a pointed end, ciliate on the under surface. Flowers are white, in sparse, thin and with hanging false ears. Fruit is black, nut-like and has a flat and domed side.¹

**Origin:** Native to Northern Africa, tropical and temperate Asia, Australia and Europe.²

**Phytoconstituents:** Rhamnazin, hydropiperside, polygodial, warburganal, isopolygodial, isodrimeninol, drimenol, confertifolin and others.¹³⁵

**Traditional Medicinal Uses:** The liquid extract of the plant is used as a contraceptive and a haemostatic.⁶ The plant is also used alone or with other herbs decocted for diarrhoea, dyspepsia, dysentery, enteritis, diuretic, expelling worms, heat stroke, itching skin, haemorrhage, jaundice and cancer as well.⁷ In folk medicine, it is used internally for uterine bleeding, menstrual bleeding, bleeding of haemorrhoids, gastrointestinal bleeding, rheumatic pain, as a diuretic, for bladder and kidney disease, and gout. It is used externally for poorly healing wounds, sprains and contusions.¹³ The leaves are
pounded and applied to skin diseases, for uterine disorders, while its seeds are used as carminative, diuretic and stimulant.

**Pharmacological Activities:** Analgesic, Anthelmintic, Antifertility, Antifungal, Antineoplastic, Antioxidant, Antimutagenic and Insect repellent.

**Dosage:** A tea prepared by pouring 0.25 L of hot water over 1 heaped teaspoon of the dried plant extract and strained after 10 min is to be drunk 3 times a day. Homeopathically, it is used to treat varicose veins, 5 drops, 1 tablet or 10 globules are to be taken every 30 to 60 min in acute cases, or 1 to 3 times daily for chronic cases.

**Adverse Reactions:** No known side effects with therapeutic dosages. Larger amounts can cause gastroenteritis. Skin irritation may occur if applied externally.

**Toxicity:** Toxic to animals and the LD$_{50}$ for its chloroform leaf extract was 758.58 mg/kg in male albino mice.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
57. *Phyllanthus amarus* Schum. & Thonn.  
(Euphorbiaceae)

*Pick-a-back, Carry Me Seed, Ye Xia Zhu*

**Description:** *Phyllanthus amarus* Schum. & Thonn. is a small herbaceous annual plant that can grow up to 60 cm tall. Leaves are simple, alternate, green and stipulate. The blade is 3–8 mm by 2–4.5 mm and oblong-elliptic. The fruits are green, depressed globose in shape, 3-lobed and smooth. Both the flowers and fruits are borne under the branches.\(^{[1,2]}\)

**Origin:** Native to Mexico and South America.\(^{[3]}\)
Phytoconstituents: Phyllanthusin D, geraniin, corilagin, elaecarpusin, amariin, amariinic acid, amarosterol-A and B, phyllantin, hypophyllantin and others. [4–11]

Traditional Medicinal Uses: The aerial part of the plant is used for various conditions. In Chinese medicine, the plant is made into a tea to cure kidney problems, venereal diseases, stones in the kidneys and bladder. The Malays use it to increase menstrual flow, reduce fever and cure colic. It is used by the Indians as a fish poison. [5] Indians also use the plant as liver tonic to treat liver ailments, ascites, jaundice, diarrhea, dysentery, intermittent fever, conditions of the urogenital tract, eye disease, scabies, ulcers and wounds. [12] In Vietnam, it is used to induce sweating, and increase menstrual flow. It is also prescribed for toothache, muscle spasms and gonorrhoea. It is considered a diuretic, colic remedy and abortifacient in Southeast Asia. [5] It is also commonly used in Benin, Africa, as folk medicine against malaria. [13]

Dosage: A decoction may be prepared with 10 plants in 1 L of water. [12]

Adverse Reactions: No known side effects with therapeutic dosages. [12]

Toxicity: Non-toxic to mice at a dose of 100 mg/kg body weight [18] but at doses of 400 mg/kg, 800 mg/kg and 1000 mg/kg body weight in rats. [48]

Contraindications: No information as yet.

Drug-Herb Interactions: An alcoholic extract of P. amarus was found to inhibit cytochrome P450 enzymes both in vivo as well as in vitro. [48]
58. **Piper nigrum** L. (Piperaceae)

*Pepper, Lada*

**Description:** *Piper nigrum* L. is a perennial woody vine with aerial roots at the stem nodes. Leaves are shiny, broad, alternate and heart-shaped. Flowers are small and white. The fruits are globular berries, about 5 mm in diameter, green when unripe but turn bright red upon maturity and each bears a single seed.[1]

**Origin:** Native to Southeast Asia.[2]

**Phytoconstituents:** Piperine, sabinene, nigramides A–S, pipertipine, piper- citine; pellitorine, guineensine, piperettine, pipericine, dipiperamides A–C, pipnoohine, pipyahyine and others.[3–10]

**Traditional Medicinal Uses:** The plant is used in many Asian countries as a stimulant, for the treatment of colic, rheumatism, headache, diarrhoea, dysentery, cholera, menstrual pains, removing excessive gas and increasing the flow of urine.[11] It is also used in folk medicine for stomach disorders and digestive problems, neuralgia and scabies. In Ayurveda, it is used for arthritis, asthma, fever, cough, catarrh, dysentery, dyspepsia, flatulence, haemorrhoids, urethral discharge and skin damage. In Chinese medicine, it is used for
vomiting, diarrhoea and gastric symptoms. Homeopathically, it is used for irritation of mucous membrane and galactorrhoea. A heavy dose of pepper with wild bamboo shoots is said to cause abortion. In Assam, a method of birth control include Cissampelos pareira in combination with Piper nigrum, root of Mimosa pudica and Hibiscus rosa-sinensis. The fruits are used to remove excessive gas in system, increase flow of urine, treat colic, rheumatism, headache, diarrhoea, dysentery, cholera, and menstrual pains. White pepper is used for cholera, malaria, stomachach while black pepper is used for abdominal fullness, adenitis, cancer, cholera, cold, colic, diarrhoea, dysentery, dysmenorrhea, dysuria, furuncles, headache, gravel, nausea, poisoning due to fish, mushrooms or shellfish.

**Pharmacological Activities:** Antibacterial, Antidiabetic, Antifungal, Anti-inflammatory, Antineoplastic, Antioxidant, Gastroprotective, Hepatoprotective, Hypolipidaemic, Antimutagenic, Antithyroidal and Insecticidal.

**Dosage:** A single dose ranges from 300–600 mg of the berries is taken internally for stomach disorder. Homeopathic recommendations for irritation of mucous membranes and galactorrhoea are 5–10 drops, 1 tablet or 5–10 globules 1–3 times daily. For the treatment of haemorrhoids, 5–15 whole peppercorns are recommended to be taken. For congestion, cold, head cold, chicken soup with black pepper can be taken. The average daily dose of the berries is stated to be 1 to 3 g as a decoction, powder or pills, for the treatment of dyspepsia, vomiting, diarrhoea and colic resulting from cold.

**Adverse Reactions:** No known side effects with appropriate therapeutic dosages. Hypersensitivity may occur in certain people. The fruit can be safely consumed with proper usage. However, when taken in large amounts in children, apnoea can occur. Piper nigrum did not cause any adverse effects when tested with rats at doses 5 to 20 times normal human intake. No known side effects with appropriate therapeutic dosages. Hypersensitivity may occur in certain people. The fruit can be safely consumed with proper usage. However, when taken in large amounts in children, apnoea can occur. However, when taken in large amounts in children, apnoea can occur. However, when taken in large amounts in children, apnoea can occur. However, when taken in large amounts in children, apnoea can occur. However, when taken in large amounts in children, apnoea can occur. However, when taken in large amounts in children, apnoea can occur.

**Contraindications:** Not to be taken during pregnancy and lactation or by children and people who are allergic to it.

**Drug-Herb Interactions:** Piper nigrum extracts inhibits the activity of cytochrome P450 enzymes. Piperine enhanced the bioavailability of beta lactam antibiotics, amoxycillin trihydrate and cefotaxime sodium significantly in rats. Piperine potentiated pentobarbitone sleeping time in a dose dependant manner, with peak effect at 30 min.
bioavailability of phenytoin significantly, possibly by increasing the absorption.[51] Piperine from black peppers increased the AUC of phenytoin, propranolol and theophylline in healthy volunteers and plasma concentrations of rifampicin in patients with pulmonary tuberculosis.[52] Avoid concurrent use with drugs metabolised by cytochrome P450 enzymes.[43] Avoid concurrent use with anticoagulant agents as well.[53]
59. *Piper sarmentosum* Roxb. (Piperaceae)

Wild Pepper, Kadok, Sirih Tanah

*Piper sarmentosum* herb

Close up of *Piper sarmentosum* flowers and fruits
Description: Piper sarmentosum Roxb. is a climbing herb that can grow up to 10 m long with long runners that can develop into plantlets. Leaves are alternate, simple, 7–14 cm by 6–13 cm, heart-shaped and young leaves have a waxy surface. Flowers are bisexual or unisexual, in terminal or leaf opposite spikes. Fruit is small, dry, with several rounded bulges. Plant has a characteristic pungent odour.[1–5]

Origin: Native to Cambodia, India, Indonesia, Laos, Malaysia, Philippines and Vietnam.[5]

Traditional Medicinal Uses: The whole plant can be used to treat fever and aids digestion.[3] The fruit is used as an expectorant[6] while the roots are used to treat toothache, fungal dermatitis on the feet, coughing, asthma and pleurisy.[6,12]

Dosage: No information as yet.

Adverse Reactions: No information as yet.

Toxicity: No information as yet.

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
60. **Plantago major** L. (Plantaginaceae)

Common Plantain, Whiteman’s Foot, Daun Sejumbok

*Plantago major* L. is a small perennial herb. Leaves are nearly all basal, exstipulate, lanceolate to ovate, 5–20 cm long and rosette. Flowers are small, white, in dense spike-like inflorescence. Sepals are broadly elliptic, oblong to rounded obtuse or subacute and corolla are greenish or yellowish, with four lobed and imbricate. Seeds are dull black and endospermous.[1,2]

**Origin:** It is found in Europe, Northern and Central Asia, and introduced all over the world.[2]

**Phytoconstituents:** Aucubin, catalpol, scutellarein, nepetin, chlorogenic acid, neochlorogenic acid, hispidulin, homoplantaginin, nepitrin, ursolic acid and others.[3,4]
Traditional Medicinal Uses: The Greeks and Romans used it as an astringent, to heal wounds, asthma, fever and eye disorders.[5] In Brazil, it has been used to treat skin ulceration (cutaneous leishmaniasis) caused by Leishmania braziliensis.[6] P. major has been used in Turkey in the treatment of ulcers by taking the powdered dried leaves together with honey daily before breakfast.[7] Infusion of the leaf has been taken for diarrhoea, ulcers, bloody urine, digestive disorders, and excess mucous discharge. The American Indian groups make use of a poultice of the leaves for pain, swelling, cuts, wounds, sores, infections, blisters, insect bites, snakebites and haemorrhoids.[5] Its seeds are used to induce sweating, increase flow of urine, treat diarrhoea, dysentery, rheumatism, malaria, asthma, kidney problems, bladder diseases, gonorrhoea and piles.[3] Its roots are used to treat fever, respiratory infections and constipation.[5] The Commission E approved the internal use of plantain for catarrhs of the respiratory tract and inflammatory alterations of the oral and pharyngeal mucosa while its external application is approved for inflammatory reactions of the skin.[8]

Dosage: A daily dose of 8 to 16 g of the whole plant or seeds in the form of a decoction or extract is used to treat oedema, dysuria, haematuria, persistent cough, bronchitis and ophthalmia.[31] Approximately 2 to 4 ml of the fluid extract taken orally three times daily serves for general well being.[32] As a rinse or gargle, 1.4 g of cut herb is immersed in 150 ml of cold water for 1 to 2 hours.[8] For internal use, 1.4 g of herb is immersed in 150 ml of boiled water for 10–15 min, drunk as infusion, for 3 to 4 times daily.[8]

Adverse Reactions: Nausea, vomiting, diarrhoea, anorexia, bloating, hypersensitivity and dermatitis may arise. Life threatening anaphylaxis may occur in more serious cases.[32]

Toxicity: The 70% ethanol extract was found to be toxic to shrimps[33] but P. major possesses a low toxicity in rats after oral and intraperitoneal administration.[34]
Contraindications: Should not be used during pregnancy and lactation. Should not be used in persons with intestinal obstruction or those who developed hypersensitivity to plantain.[32]

Drug-Herb Interactions: Decreases the effects of carbamazepine and enhances the effects of cardiac glycosides, β-blockers and calcium channel blockers.[32]
**Description:** *Punica granatum* L. is a small woody shrub that can grow up to 3–4.5 m tall. Leaves are opposite, oblong-lanceolate, 3–8 cm and branches are spiny. Flowers are large, trumpet-shaped, and bright orange-red in colour. Fruit is globose, with waxy surface, tough leathery skin, turns deep pink or red upon maturity, and contains numerous seeds with fleshy covering.[1]

**Origin:** Native to temperate and tropical Asia.[2]

**Phytoconstituents:** Punicafolin, punicalagin, friedelin, betulic acids, estrone, estradiol, piperidine, pomegranate, pseudopelletierine and others.[3–7]

**Traditional Medicinal Uses:** The plant is used in folk medicine to expel worms, for diarrhoea, dysentery, as an abortifacient, astringent, for haemorrhoids (when used externally) and as a gargle for sore throat. In Ayurveda it is used for diarrhoea, dysentery, vomiting, and eye pain. Used in Chinese medicine for chronic diarrhoea and dysentery, it is also used to treat blood in
stools, worm infestation, and anal prolapse. Homeopathically, it is used for gastrointestinal disturbances. The leaves are used to relieve itch. The pericarp is used to treat diarrhoea, rectocele and to expel pinworms. The dried pericarp is decocted with other herbs for colic, colitis, diarrhoea, dysentery, leucorrhoea, menorrhagia, oxyuriasis, paralysis and rectocele, to treat piles, yellowish discharge from the vagina, sore throat, bad breath and nose bleed. The stem bark is used as an emmenagogue and for dysentery.

**Pharmacological Activities:** Anthelmintic, Antibacterial, Anticancer/Antineoplastic, Antidiabetic/Hypoglycaemic, Antidiarrhoeal, Antifertility, Antifungal, Anti-inflammatory, Antimalarial, Antioxidant, Antiviral, Gastroprotective, Hepatoprotective, Hypolipidaemic, Immunomodulatory, Neuroprotective, Antiatherogenic, Wound healing, Larvicidal and Molluscicidal.

**Dosage:** Daily dose for the treatment of tapeworm is one part pericarp, root, or stem bark boiled with 5 parts of water. Bark juice extract is recommended for tapeworm at a single dose of 20 g. Otherwise, 250 parts powdered bark are boiled in 1500 parts water for 30 minutes. Doses of 4–5 g of powdered dried flower are used in haematuria, haemorrhoids, dysentery, chronic diarrhoea, and bronchitis. Either 1.5–3 g of root and bark powder, 100–200 ml of bark decoction (for children, 28–56 ml) is used for anthelmintic purposes. 7 g flower in 300 ml water is prescribed for inflamed mouth and throat; 5–12 g root or stem bark boiled in 240 cm³ water until 1/3 has evaporated and taken on a 3 hourly basis on empty stomach 2 hours after taking 40 ml castor oil. A daily dose of 20 to 50 g of dried root bark or stem bark as a decoction is used in the treatment of taeniasis (tapeworm infection). Daily dose of 15 to 20 g fruit rind in the form of a decoction is taken to treat dysentery and diarrhoea.

**Adverse Reactions:** No known side effects with appropriate therapeutic dosages. In some cases, gastrointestinal disturbances may occur due to high tannin content. Pomegranate fruits have rarely been reported to cause immediate hypersensitivity.

**Toxicity:** The bark and peel are toxic. Contraindications: Contraindicated in the elderly, children and pregnant women. Pericarp is contraindicated in diarrhoea. Should not be taken with fats or oils when it is used for killing parasites. Should not be used by patients with hepatic diseases or asthma, and who are hypersensitive to pomegranate.

**Drug-Herb Interactions:** Inhibition of cytochrome P450 enzymes, interaction with carbamazepine and interaction with tolbutamide.
62. **Rhodomyrtus tomentosa** (Ait.) Hassk
(Myraceae)

Rose Myrtle

**Description:** *Rhodomyrtus tomentosa* (Ait.) Hassk is a bushy shrub with woolly young parts. Leaves are simple, oblong, 4–10 cm, opposites with three main longitudinal veins. Flowers are large, showy and pink, 3–4 cm wide, solitary and auxiliary. Berries are oblong, 1–1.25 cm long, dark purple, fleshy and aromatic.[1–3]

**Origin:** Native to tropical and temperate Asia.[4]

**Phytoconstituents:** Rhodomyrtone, casuarin, castalagin, friedelin and others.[5–11]

**Traditional Medicinal Uses:** The leaves are used by the Chinese as a pain-killer. They are also used in Indonesia to heal wounds.[1] In Malaysia, the plant, including the roots, are decocted to treat diarrhoea and heartburn.[5,6] The buds and young leaves are used for treatment of colic, diarrhoea, dysentery, abscesses, furunculosis and haemorrhage. Concentrated decoction of leaves is used as a disinfectant for wounds, impetigo and abscesses.[12] The seeds are used as a digestive tonic and to treat snake bites.[1]

**Pharmacological Activities:** Antibacterial.[8]
**Dosage:** Daily dose of 10 to 30 g of fresh buds or young leaves in the form of an extracted juice or dried for use as a powder or in a decoction is used for the treatment of colic, diarrhoea, dysentery, abscesses, furunculosis and haemorrhage.\textsuperscript{[12]}

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
63. *Rhoeo spathacea* (Sw.) Stearn (Commelinaceae)

Purple-leaved Spider Wort, Moses-in-the-Cradle, Oyster Plant

**Description:** *Rhoeo spathacea* (Sw.) Stearn is a short-stemmed herb with underground rhizome that can grow up to 90 cm tall. Leaves pointed upwards, fleshy, hard, long, narrow, 15–25 cm by 3–5 cm, pointed, dark green on the adaxial surface and purple on abaxial surface. Flowers are small, white, and concealed within a boat-shaped envelope of two bracts.[1,2]

**Origin:** Native to Central America and West Indies, widely cultivated as ornamental plants in most tropical countries.[2]

**Phytoconstituents:** No information as yet.

**Traditional Medicinal Uses:** They are used to treat intestinal bleeding, blood in the sputum and dysentery.[3]

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
Ricinus communis L. (Euphorbiaceae)

Castor Oil Plant, Castor Bean

Description: Ricinus communis L. is an erect herb, growing up to 3.6 m high, having pinkish succulent stem and large alternate palmate leaves that are green or reddish brown. Leaves are lobed, consisting of 6–8 radiating leaflets with serrated edges and prominent central veins. Flowers are green, pink or red and inconspicuous, with no petals. The fruits are capsular, with three lobes, prickly and green, containing three seeds.[1]

Origin: Native to Africa, naturalised throughout tropics and subtropics.[2]
**Phytoconstituents:** Ricin, ricinoleic acid, ricinine, p-coumaric acid, ferulic acid, o-coumaric acids, syringic acid, cinnamic acids, stigmasterol, fucosterol and others. [3–8]

**Traditional Medicinal Uses:** Its leaf poultice is applied to boils and sores in India; to treat headaches and fever in Hawaii. [9] The leaves and roots are used in a decoction for anal prolapse, arthritis, constipation, facial palsy, lymphadenopathy, strabismus, uterine prolapse, cough, and also as a discutient and expectorant. The heated leaves are applied to gout and swellings as well. [5] The leaves and oil are used for dermatological purposes in Nigeria. [10] Its seeds are used to treat abscesses and skin eruptions, deafness, headache, skin problems, bleeding, constipation, boils, piles and to promote labour. [4] They are rubbed on the temple for headache, powdered for abscesses, boils, and carbuncles. The plant is also used for dogbite, scrofula and several skin infections. The Chinese rub the oil on the body for skin ailments. The seeds are crushed and made into a pulp and rubbed into the palms for palsy, introduced into the urethra in stricture and rubbed on the soles of feet of parturient woman to hasten birth or expulsion of the placenta. The seeds are also used to treat colic, diarrhoea, dysentery, enteritis, acute constipation, for itching, ringworms, warts, dandruff, hair loss and haemorrhoids. It is also used as a laxative before X-ray examination of bowels. [3,5] Midwives sometimes use castor oil to induce labour. [13]

**Dosage:** For internal use in the treatment of constipation or to expel worms, at least five 2 g capsules or ten 1 g capsules are recommended. [3] Externally, a paste made of ground seeds may be applied to affected skin areas 2 times daily, up to 15 days. [3] Homeopathically, 5 drops, 1 tablet or 10 globules are recommended every 30–60 min for acute treatment or 1–3 times daily for chronic cases. [3] Standard adult dose is reported to be 5.0–20.0 ml/dose, not exceeding 60.0 ml per day. Standard child dose is reported to be 4.0–12.0 ml/dose. [11] The seed oil is recommended for use as a laxative in a dose of 2 to 5 ml and as a purgative in a dose of 20 to 30 ml. 15 seeds may be crushed and applied to the plantar surface of the feet for the induction of labour at term and placenta delivery in cases of placenta retention. [25] The woman's feet are advised to be thoroughly washed after
delivery of foetus and placenta.\textsuperscript{[25]} For constipation, it is reported that 15 to 60 ml of castor oil may be taken orally a day.\textsuperscript{[26]}

**Adverse Reactions:** Gastric irritation, nausea, vomiting, colic, and severe diarrhoea may occur. Long term use may result in loss of electrolytes, especially potassium, and causes intestinal motility inhibition.\textsuperscript{[3]}

**Toxicity:** Seeds are highly poisonous due to the toxic lectins, principally the albumin and ricin.\textsuperscript{[27]} The seeds are toxic to both animals and humans.\textsuperscript{[3,12,26–35]}

**Contraindications:** Not to be taken by children under 12 years of age, patients with acute inflammatory intestinal diseases, inflammatory bowel disease and appendicitis.\textsuperscript{[3]} contraindicated in pregnancy, intestinal obstruction and abdominal pain.\textsuperscript{[3,11]} Not to be given with potentially toxic oil-soluble anthelmintics.\textsuperscript{[36]}

**Drug-Herb Interactions:** Effect of cardioactive steroids may be increased.\textsuperscript{[3]} To prevent decreased absorption of castor, it is advised not to take within one hour of antacids, other drugs and milk.\textsuperscript{[37]}
65. **Ruta graveolens** L. (Rutaceae)

**Herb of Grace, Common Rue**

**Description:** *Ruta graveolens* L. is a glabrous herb with stem that can grow up to 14–45 cm. Lower leaves are more or less long-petiolate with ultimate segments 2–9 mm wide, lanceolate to narrowly oblong. Inflorescence is rather lax; pedicels are as long as or longer than the capsule; bracts are lanceolate and acute. Petals are oblong-ovate, denticulate and undulate. Capsule is glabrous; segments somewhat narrowed above to an obtuse apex.

**Origin:** Native to Europe.

**Phytoconstituents:** Rutoside, rutaverine, arborinine, rutin, elemol, pregeijerene, geijerene, furocoumarins, bergapten, xanthotoxin, fagarine, graveolinine and others.

**Traditional Medicinal Uses:** It is frequently used to treat worm and parasitic infection. It has been commonly used for the treatment of psoriasis and vitiligo due to the psoralens and methoxypsoralens present. It is also used to relieve muscle spasms, as carminative, emmenagogue, haemostat, uteronic, vermifuge, to treat hepatitis, dyspepsia, diarrhoea, bug bite, cancer, cold, fever, snakebite, earache, toothache and as an antidote especially in malarial poisoning. It is also used as an abortifacient to terminate pregnancy. The plant has been used for pain relief in Mexico.

Dosage: For the treatment of earache, the oil is poured on cotton and inserted into the affected ear. For oral administration, 1 capsule or 0.5 to 1 teaspoon of extract is taken three times daily with meals. The topical cream may be applied to the affected area when necessary.[26] For delayed menstruation, 2 cups of infusion per day is used.[8]

Adverse Reactions: Hypotension, hypersensitivity, rash, erythema and blisters may occur when applied topically.[26] Therapeutic dosages could bring about melancholic moods, sleep disorders, tiredness, dizziness and spasms.[27] Misuse as an abortive during pregnancy can lead to vomiting, epigastric pain, kidney damage, depression, sleep disorders, feelings of vertigo, delirium, fainting, tremor, spasm and sometimes may end up with fatal outcome.[8]

Toxicity: Toxic to humans[27–33] and animals.[34]

Contraindications: Should not be used during pregnancy.[9] Should not be used during lactation, in children and in person with hypersensitivity to rue. Patients with heart diseases should use it with caution,[26] Contraindicated in patients with poor renal function.[9]

Drug-Herb Interactions: Concurrent use of cardiac glycosides (e.g. digoxin, digitoxin) with rue may cause increased inotropic effects. Concurrent use of antihypertensives with rue may cause increased vasodilation.[26]
66. Saccharum officinarum L. (Gramineae)

Sugarcane, Tebu

Description: Saccharum officinarum L. is a perennial plant that forms tall clumps that can grow up to 6 m tall. Stems are greenish, yellowish or dark purplish and juicy. Leaf blades are broadly linear, glabrous and 80–150 cm by 4–6 cm. Inflorescence is a large silky panicle.[1,2]

Origin: Native to Southeast Asia and Pacific Islands, widely cultivated elsewhere.[2]

Phytoconstituents: Octacosanol, policosanol, orientin, tricin-7-O-glycoside, palmitic acid, oleic acid and linolenic acid and others.[3-9]

Traditional Medicinal Uses: Consumption of beets (Beta vulgaris) combined with molasses from S. officinarum, is used by Dominican healers to shrink fibroids or to “strengthen and fortify the uterus after the fibroid had been drained from the body”. [10] The cane juice promotes expulsion of phlegm from the respiratory passages, stimulates gastric activities, treats wounds, ulcers and boils. [11]

Dosage: Short-term studies have shown the efficacy and tolerability of policosanol at 10 mg/day on hypercholesterolaemia in obese patients with Type 2 diabetes.[19,20]

Adverse Reactions: Pollen extract of S. officinarum showed strong sensitising potential which induces allergy.[29]

Toxicity: Studies on the toxicity of higher aliphatic primary acids (D003) and higher aliphatic primary alcohols (policosanol) isolated from S. officinarum did not show any toxic effects.[30–33]

Contraindications: No information as yet.

Drug-Herb Interactions: Pretreatment with high doses of policosanol significantly increased propranolol-induced hypotensive effects, while the effects of nifedipine remained unchanged. Policosanol does not antagonise the hypotensive effect of β-blockers but it can increase the hypotensive effect of beta-blockers without modifying cardiac frequency.[34] Pretreatment with single doses of policosanol significantly increased the nitroprusside-induced hypotensive effect.[35] Warfarin alone and the combination of policosanol and warfarin induced a moderate, but significant prolongation of the bleeding time.[36]

[Authors’ Note: Freshly squeezed sugarcane juice is commonly consumed and sugar is commercially obtained from sugarcane.]
67. Sauropus androgynus (L.) Merr.
(Euphorbiaceae)

Sweet Leaf Bush, Cekup Manis, Daun Katuk

Description: Sauropus androgynus (L.) Merr. is a small shrub that can grow up to 3 m tall. Leaf blade is ovate-lanceolate, oblong-lanceolate, or lanceolate, 3–10 cm by 1.5–3.5 cm and thinly papery. Flowers are small and borne in axillary clusters. Mature fruit is about 5 cm wide. Young branches and leaves are used as vegetable.\(^1\)\(^,\)\(^2\)

Origin: Native to China and tropical Asia.\(^3\)

Phytoconstituents: Sauroposide, (-)-isorariciresinol, corchoionoside C and others.\(^4\)\(^–\)\(^10\)

Traditional Medicinal Uses: The fresh leaves or roots possess uterotonic activity and are used for the treatment of retained placenta. A mouth wash...
made from the juice of the fresh leaves and honey, and applied to the tongue and gums cures thrush of the tongue in infants. The leaves are used for erythema, measles and dysuria. Its roots serve as a diuretic and relieve congestion.\[4\] The root decoction is used for fever and urinary bladder complaints.\[11\]

**Pharmacological Activities:** Anthelmintic.\[12\]

**Dosage:** For the treatment of retained placenta, a dose of 40 g, in the form of an extracted juice is administered in 2 subdoses at 10 minutes interval.\[4\]

**Adverse Reactions:** Excessive consumption of the leaf reportedly caused dizziness, drowsiness and constipation.\[13\]

**Toxicity:** Reported to cause bronchiolitis obliterans,\[14–16\] ischaemic bronchi necrosis,\[17\] irreversible obstructive ventilatory defect,\[18,19\] breathing difficulties\[20,21\] and is cytotoxic.\[22\]

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
68. *Sesbania grandiflora* Pers. (Leguminosae)

Scarlet Wisteria Tree, Red Wisteria, Daun Turi

**Description:** *Sesbania grandiflora* Pers. is a tree that can grow to 8–10 m in height. The compound leaves are about 30 cm long with 12 to 20 pairs of rounded, narrow, oblong leaflets, 3–4 cm by 1 cm. Flowers are 5–10 cm by 3 cm, in pale pink, red, purple or white. The pods are 25–50 cm, slender, and cylindrical with many light brown to red brown seeds.[1]

**Origin:** Native to Malesia and cultivated in the tropics.[2]

**Phytoconstituents:** Grandiflorol, (+)-leucocyanidin, oleanolic acid, lutein, beta-carotene, violaxanthin, neoxanthin, zeaxanthin and others.[3–9]
Traditional Medicinal Uses: In the Philippines, the plant is used for its hypotensive properties. It is used in Indian folk medicine for the treatment of liver disorders. The juice of the leaves and flowers are popularly used for nasal catarrh and headache when taken as snuff. Various leaf preparations are used to treat epileptic fits. Applied externally for treatment of leprous eruptions. A poultice of the leaves is used for bruises. The leaf juice is mixed with honey for congenital bronchitis or cold in babies.

Dosage: No information as yet.

Adverse Reactions: No information as yet.

Toxicity: No information as yet.

Contraindications: No information as yet.

Drug-Herb Interactions: No information as yet.
69. **Solanum nigrum** L. (Solanaceae)

Black Nightshade, Terong Meranti, Poison Berry

**Description:** *Solanum nigrum* L. is a small herb, up to 1.5 m tall. Leaves are ovate, ovate-oblong, glabrous, hairy, 1–16 cm by 0.25–12 cm. Inflorescence of 2–10 in an extra-axillary cluster, with white or purple corolla and yellow central protrusion. Fruit is globose, black in colour but is green when immature, 0.5 cm in diameter, with many seeds.[1]

**Origin:** Native to Southwest Asia, Europe, India and Japan.[2]

**Phytoconstituents:** Solanidine, α-, β-, γ-chaconine, desgalactotigonin, α-, β-solamargine, diosgenin, solanadiol, α-, β-, γ-solanines, soladulcidine, solanocapsine, α-, β-solansodamine, solasodine, α-solasonine, tigogenin, tomatidenol, uttronins A and B, uttrosides A and B, solanigroside A–H and others.[3–9]
**Traditional Medicinal Uses:** The stem, leaves and roots are used as a decoction for wounds, tumours and cancerous growths, sores and as an astringent. They are also used as a condiment, stimulant, tonic, for treatment of piles, dysentery, abdominal pain, inflammation of bladder, relief of asthma, bronchitis, coughs, eye ailments, itch, psoriasis, skin diseases, eczema, ulcer, relief of cramps, rheumatism, neuralgia and expulsion of excess fluids. The roots are used as an expectorant. The plant has yielded medicines for sore throats, coughs and digestive problems. It has also been used as an agricultural insecticide. Europeans in Africa used the plant to treat convulsions. It is used by the Africans for treating headache, ulcers and as a sedative. The whole plant is used for the treatment of dermatitis, inflammation, heavy female discharge, diarrhoea and dysentery. It is also used as a diuretic and febrifuge. Whole plant is decocted for abscesses, cancer of the cervix, inflammation, leucorrhoea and open sores. Young shoots are consumed as virility tonic for men and to treat dysmenorrhoea in females. In Indochina, the leaves are used as purgeative and high blood pressure lowering agents while the fruits are used as laxatives.

**Dosage:** 10 drops of extract is taken internally 2 to 3 times a day or 5 to 10 g of tincture may be taken daily for gastric irritation, cramps and whooping cough. For external use as a rinse of moist compress, it is boiled in 1 L water for 10 minutes before usage for psoriasis, haemorrhoids, abscesses, eczema and bruising.

**Adverse Reactions:** No known side effects with appropriate therapeutic dosage.

**Toxicity:** Harmful to rats. It is toxic to cattle as it can cause acute nitrate toxicity which leads to death in cattle. In chronic cases, decreased milk yield, abortion, impaired vitamin A and iodine nutrition can occur. The proposed LD$_{50}$ for nitrate toxicity is 160-224 mg/NO$_3$/kg for cattle. Overdoses can lead to headache, nausea and vomiting, due to high alkaloid content. Mydriasis may also occur, although rare. Solanine, in doses of 200-400 mg, may cause gastroenteritis, tachycardia, dyspnea, vertigo, sleepiness, lethargy, twitching of the extremities and cramps. It is also teratogenic.

**Contraindications:** No information as yet.

**Drug-herb Interactions:** No information as yet.
70. **Swietenia macrophylla** King (Meliaceae)

Honduras Mahogany, Broad-leaved Mahogany

**Description:** Swietenia macrophylla King is an evergreen tree, up to 30–35 m tall. Bark is grey and smooth when young, turning dark brown, ridged and flaky when old. Leaves are up to 35–50 cm long, alternate, glabrous with 4–6 pairs of leaflets. Each leaflet is 9–18 cm long. Flowers are small and white; and the fruit is dehiscent, usually 5-lobed capsule, erect, 12–15 cm long, grayish brown, smooth or minutely verrucose. The seed is woody, glossy and possesses wing-like structure at the base that aids its dispersion by wind.[1]

**Origin:** Native to South America, cultivated in the Asia-Pacific and the Pacific for its quality wood.[1]

**Phytoconstituents:** Swietenine, swietenolide, andirobin, khayasin T, swietenahonins E–G, swietenine acetate, swietenolide tiglate and others.[2–7]

**Traditional Medicinal Uses:** The seeds of Swietenia macrophylla are traditionally used in several indigenous systems of medicine for the treatment of various ailments such as hypertension, diabetes and malaria.[9] The local folks of Malaysia believe that the seeds are capable of “curing” hypertension and diabetes. The seeds are usually consumed raw by chewing.[8] A decoction of seeds of Swietenia macrophylla is reported to treat malaria in Indonesia.[9] Among the Amazonian Bolivian ethnic groups, the seeds are traditionally
used to induce abortion by drinking a decoction of the seeds and to heal wounds and various ailments of the skin via external application of the mashed seeds.\[10\]

**Pharmacological Activities:** Antimalarial,\[11\] Antihypertensive\[8\] and Antidiarrhoeal.\[12\]

**Dosage:** No information as yet.

**Adverse Reactions:** No information as yet.

**Toxicity:** Uterine haemorrhage.\[13\]

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
71. **Terminalia catappa** L. (Combretaceae)

**Indian Almond, Katapang**

**Description:** *Terminalia catappa* L. is a tall tree, up to 25 m tall. Branches are horizontally whorled, giving it a pagoda shape. Leaves are shiny, obovate, 10–25 cm long, tapering to a short thick petiole. Leaves are yellow that turn red before shedding. Flowers are small and white. Fruits have smooth outer coat, 3–6 cm long, flattened edges, with a pointed end. Pericarp is fibrous and fleshy.\[^{1–3}\]

**Origin:** Native to tropical and temperate Asia, Australasia, the Pacific and Madagascar.\[^{4}\]

**Phytoconstituents:** Catappanin A, chebulagic acid, 1-desgalloylleugeniin, geraniin, granatin B, punicalagin, punicalin, tercatain, terflavins A & B, tergallagin, euginic acid and others.\[^{2,5–13}\]

**Traditional Medicinal Uses:** *Terminalia catappa* has been used to treat dysentery in a number of Southeast Asian countries. In Indonesia, the leaves are used as a dressing for swollen rheumatic joints while in the Philippines, they are used to expel worms.\[^{2}\] In Karkar Island, New Guinea, juice from
the squeezed leaves is applied to sores and the sap from the white stem pith is squeezed and drunk to relieve cough. In Nasingalatu, Papua New Guinea, the flower is crushed, mixed with water and drunk to induce sterility. In New Britain, the old yellow leaves are crushed in water and drunk to sooth sore throat. In Bougainville, the leaves are heated and placed on pimples and the bark is applied to sores. In Tonga, the juice from pounded leaves and bark is applied to mouth sore. In Irian Jaya, the leaves are applied to wounds and burns while in Somoa, it is used to cure cough and sore throat.[14] The fruits are used after childbirth to strengthen the back. An enema made from the crushed fruit mixed with Trigonella foenum-graecum, animal fat and warm water is administered to the new mother after childbirth.[15] The leaves are used for the treatment of scabies and skin diseases while the juice is used to treat headache and colic.[13,14] The bark is used as a diuretic, cardiotonic and for dysentery.[16] The leaves of this plant have also been used as a folk medicine for treating hepatitis in India and Philippines.[5]

**Dosage:** 2 tablespoons of a decoction (few leaves in 200 ml water) is given every 2 hours to stop diarrhoea.[34]

**Adverse Reactions:** No information as yet.

**Toxicity:** Preliminary oral LD$_{50}$ doses of petroleum ether, methanol and aqueous extracts of T. catappa in mice were found to be 343, 195, and 210 mg/kg respectively.[8] Rats fed on T. catappa diet maintained their body weight but suffered from stomach, small intestine and pancreas hypertrophies as well as spleen atrophy.[35] Larger doses enhanced liver damage.[36]

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
(Apocynaceae)

Yellow Oleander, Trumpet Flower

**Description:** *Thevetia peruviana* (Pers.) K. Schum. is a shrub, up to 6 m tall. All parts contain highly poisonous milky latex. Leaves are simple, few, exstipulate and spirally arranged. Blade is linear, 7–13 cm by 0.5–1 cm and glossy. Flowers are large, yellow, 5 cm across, gathered in few flowered terminal cymes. Fruits are green, shiny, globose, 4–5.5 cm across with 4 or less poisonous seeds.[1]

**Origin:** Native to Central and South America.[2]

**Phytoconstituents:** Thevetins A and B, thevetosides, acetylperuvoside, epiperuviol, perusitin, theveneriin, thevebioside, thevefolin, pervianoside I–III and others.[3–6]

**Traditional Medicinal Uses:** Used as an abortifacient, to treat congestive heart failure, malaria, leprosy, indigestion, ringworm, venereal disease and
even as a suicide instrument.\textsuperscript{7} Used in India as an astringent to the bowel, useful in urethral discharge, worms, skin diseases, wounds, piles, eye problems and itch. Used in continental Europe and is considered particularly useful in mild myocardial insufficiency and digitalis intolerance.\textsuperscript{5} Its bark is used as an emetic, febrifuge, insecticidal, poison and for reviving patients with heart failure.\textsuperscript{4}

**Pharmacological Activities:** Antiarrhythmic,\textsuperscript{5} Antifungal,\textsuperscript{8} Hepatotoxicity and Nephrotoxicity,\textsuperscript{5} Larvicidal,\textsuperscript{9} Molluscicidal,\textsuperscript{10} and Cardiotonic.\textsuperscript{5}

**Dosage:** No information as yet.

**Adverse Reactions:** Vomiting, dizziness, and cardiac dysrhythmias such as conduction block affecting the sinus and AV nodes may occur.\textsuperscript{11}

**Toxicity:** Toxic to humans,\textsuperscript{3,11–16} fishes\textsuperscript{17–19} and animals.\textsuperscript{5,20} Ingestion of half to fifteen seeds may cause a varying degree of vomiting, palpitation, arrhythmia including sinus bradycardia and could also lead to death.\textsuperscript{21} The kernels of about 10 fruits may be fatal to adults while the kernel of one fruit may be fatal to children.\textsuperscript{22}

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.

[Authors' Note: The purified glucoside thevetin, extracted from the seeds, is prescribed as a cardiotonic drug in a 0.1% solution orally, in a dose of 1 to 2 ml daily, or in 1 mg/2 ml ampoules parenterally. 1 to 2 ampoules have been given daily for its cardiotonic property.\textsuperscript{23} A dose of 2.4 mg followed by average maintenance dose of 600 µg has been shown to be effective in 22 patients with congestive heart failure.\textsuperscript{5} The herb has been administered as a thevetin tablet of 0.25 mg/tablet. A maintenance dose consists of 0.25 mg/day. For injection administration, an injection ampoule is prepared from 0.25 mg/ml diluted in a 5% glucose solution.\textsuperscript{24} However, note that thevetin is not conventionally used in clinical practice and its dosage is not found in pharmacopoeial monographs.]
73. *Tinospora crispa* (L.) Diels (Menispermaceae)

*Akar Putarwali, Batang Wali*

**Description:** *Tinospora crispa* (L.) Diels is a woody climber with numerous protrusions on the stem. Leaves are oblong-ovate, cordate, 8–9 cm by 7–8 cm and tapering to a pointed end. Flowers are small, with 6 petals, 2 mm in length and 8–27 cm racemes. Male flowers have yellow sepals whereas female flowers have green sepals. Druplets are red, juicy and 7–8 mm long.[1,2]

**Origin:** Native to Malesia, Indochina, Indian subcontinent and China.[3]

**Phytoconstituents:** Boropetol B, borapetoside B, C & F, jatrorhizine, magnoflorine, palmatine, protoberberine, tembolarine, diosmetin, cycloeucalenol, cycloeucalenone and others.[4–8]

**Traditional Medicinal Uses:** It is used for hypertension, diabetes mellitus,[9] to treat malaria, remedy for diarrhoea and as vermifuge.[6] In Malaysia, *T. crispa* extract is taken orally by Type 2 (non-insulin-dependent) diabetic patients to treat hyperglycaemia.[10]

**Dosage:** No information as yet.

**Adverse Reactions:** The plant may result in an increased risk of hepatic dysfunction due to marked elevation of liver enzymes but is reversible upon discontinuation of *T. crispa.*[17]

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** *T. crispa* extract showed 61.3% increase of cytochrome P450 3A4 (CYP3A4) enzyme inhibition after 20 min of preincubation with human liver microsomes.[18]

**Authors’ Note:** In a randomised double blind placebo controlled trial[17] to determine the efficacy of *T. crispa* as an additional treatment in patients with Type 2 diabetes mellitus who did not respond to oral hypoglycaemic drugs and refused insulin injection, 20 patients received *T. crispa* powder in capsule form at a dose of 1 gram three times daily for six months. Twenty patients received a placebo. The results showed no evidence to support the use of *T. crispa* for additional therapy in such patients. Two patients had elevated levels of liver enzymes, which was reversible on discontinuing *T. crispa*. Patients receiving *T. crispa* had significant weight reduction and cholesterol elevation. Note that the study only included patients that did not respond to oral hypoglycaemic therapy.]
**Description:** Vitex rotundifolia L. f. is an evergreen woody tree, densely covered with short hairs. Leaves are opposite, simple, ovate, broadly oblong-elliptic, 2–5 cm long by 1.5–3 cm wide, rounded or abruptly acute at the base. Inflorescence panicles are at the terminal, densely flowered, 4–7 cm long with purple corolla. Fruits are globose, 5–7 mm.\(^1\)

**Origin:** Native to Temperate and Tropical Asia, Australasia and Pacific.\(^2\)

**Phytoconstituents:** Rotundifuran, prerotundifuran, vitexilactone, previtexilactone, vitexicarpin, vitricine, vitetrifolins D–G, vitexifolins A–E, isoambreinolide and others.\(^1,3–9\)

**Traditional Medicinal Uses:** In Malaysia, various parts of the plants are considered panacea for illnesses ranging from headache to tuberculosis.\(^10\) In China, the plant has been used for the treatment of cancer.\(^11\) A poultice of the leaves is used to treat rheumatism, contusions, swollen testicles and as a doctor in sprains. In Indonesia, leaves have been used in medicinal baths, as
a tincture or for intestinal complaints.\textsuperscript{[10]} In Papua New Guinea, sap from crushed heated leaves is diluted with water and drunk to relieve headaches. The fruits are used to expel worms and in Vietnam, a decoction of dried fruits has been used to treat colds, headache, watery eyes and mastitis.\textsuperscript{[10]} In Thailand, fruits have been used for asthmatic cough and haemorrhoids.\textsuperscript{[10]} Infusion of the boiled roots is regarded as diaphoretic and diuretic, drunk for fever, after child-birth and for liver diseases.\textsuperscript{[10]}

**Pharmacological Activities:** Analgesic,\textsuperscript{[12]} Antibacterial,\textsuperscript{[13,14]} Antifungal,\textsuperscript{[15]} Anti-inflammatory,\textsuperscript{[16]} Antineoplastic,\textsuperscript{[11,15,17–20]} Antinociceptive,\textsuperscript{[8]} Antioxidant,\textsuperscript{[6]} Antiprotozoal,\textsuperscript{[21]} Hypotensive,\textsuperscript{[22]} Immunomodulatory,\textsuperscript{[17]} Antimutagenic\textsuperscript{[23]} and Insect repellant.\textsuperscript{[15]}

**Dosage:** No information as yet.

**Adverse Reactions:** V. rotundifolia may trigger various allergic reactions such as sneezing, respiratory problems, dizziness, headache and nausea.\textsuperscript{[10]}

**Toxicity:** No information as yet.

**Contraindications:** No information as yet.

**Drug-Herb Interactions:** No information as yet.
75. **Zingiber officinale** Roscoe (Zingiberaceae)

**Common Ginger**

*Description:* Zingiber officinale Roscoe is an herbaceous plant that grows up to 1.2 m high and with an underground rhizome. The stem grows above ground and leaves are narrow, long, lanceolate, with distinct venation pattern and pointed apex. Flowers are white or yellowish-green, streaked with purple and fragrant.[1]

*Origin:* Originate from tropical Asia, widely cultivated in the tropics.[2]

*Phytoconstituents:* Gingerol, zingiberene, farnesene, camphene, neral, nerol, 1,8-cineole, geranial, geraniol, geranyl acetate and others.[3–7]

*Traditional Medicinal Uses:* Ginger is the folk remedy for anaemia, nephritis, tuberculosis, and antidote to Arisaema and Pinellia.[8] Sialogogue when chewed, causes sneezing when inhaled and rubefacient when applied externally. Antidotal to mushroom poisoning, ginger peel is used for opacity of the cornea. The juice is used as a digestive stimulant and local application in ecchymoses.[8] Underground stem is used to treat stomach upset, nausea, vomiting, nose bleeds, rheumatism, coughs, blood in stools, to improve digestion, expel intestinal gas, and stimulate appetite.[9] The rhizomes are
used to treat bleeding, chest congestion, cholera, cold, diarrhoea, dropsy, dysmenorrhoea, nausea, stomachache, and also for baldness, cancer, rheumatism, snakebite and toothache.\[8\] It is also used as postpartum protective medicine, treatment for dysentery, treatment for congestion of the liver, complaints with the urino-genital system/female reproduction system and sinus.\[10\] Besides that, it is used to alleviate nausea, as a carminative, circulatory stimulant and to treat inflammation and bacterial infection.\[3\] The Commision E approved the internal use of ginger for dyspepsia and prevention of motion sickness.\[11\] The British Herbal Compendium indicates ginger for atonic dyspepsia, colic, vomiting of pregnancy, anorexia, bronchitis and rheumatic complaints.\[12\] European Scientific Cooperative on Phytotherapy (ESCOP) indicates its use for prophylaxis of the nausea and vomiting of motion sickness and to alleviate nausea after minor surgical procedures.\[13\]

**Pharmacological Activities**

- Analgesic,\[14-16\]
- Anthelmintic,\[17\]
- Antiarthritic,\[18\]
- Anticancer,\[19-33\]
- Antidiabetic,\[34,35\]
- Antidiarrhoeal,\[36\]
- Antiemetic,\[37-53\]
- Antihyperlipidaemic,\[54\]
- Antihypertensive,\[55\]
- Anti-inflammatory,\[14,15,56-66\]
- Antimicrobial,\[67-78\]
- Antioxidant,\[6,7,79-82\]
- Antispasmodic,\[88\]
- Antitussive,\[89,90\]
- Antiviral,\[91-93\]
- Anxiolytic,\[94\]
- Hepatoprotective,\[93-97\]
- Hypocholesterolaemic,\[57,98,99\]
- Hypoglycaemic,\[14,100,101\]
- Hypolipidaemic,\[102\]
- Hypotensive,\[103\]
- Immunomodulatory,\[104-106\]
- Neuroprotective,\[107\]
- Insect repellent,\[69,108\]
- Radioprotective,\[109-111\]

**Dosage:** A tea is prepared by pouring boiling water over 0.5 to 1 g of the coarsely powdered ginger for 5 min and passing through a tea strainer, taken to prevent vomiting.\[112\]

**Adverse Reactions:** Fresh rhizome can be safely consumed with proper usage.\[113\] Contact dermatitis of the fingertips has been reported in sensitive patients.\[114\]

**Toxicity:** It is nontoxic when tested in rats but overdose may cause cardiac arrhythmia and CNS depression.\[115\]

**Contraindications:** Consult physician before using ginger preparations in patients with blood coagulation disorders, taking anticoagulant drugs or with gallstones. Avoid dried rhizomes during pregnancy.\[113\]

**Drug-Herb Interactions:** Interacts with anticoagulants such as heparin, warfarin, drugs used in chemotherapy and ticlopidine. Ginger taken prior to 8-MOP (treatment for patients undergoing photopheresis) may substantially reduce nausea caused by 8-MOP.\[117\] Ginger appears to increase the risk of
bleeding in patients taking warfarin.\textsuperscript{[118]} However, ginger at recommended doses does not significantly affect clotting status, the pharmacokinetics or pharmacodynamics of warfarin in healthy subjects.\textsuperscript{[119]} Ginger also significantly decreased the oral bioavailability of cyclosporine.\textsuperscript{[120]}

\textbf{Authors' Note:} Ginger is widely eaten as a food ingredient and used in many different cultures as traditional medicine. Ongoing scientific research has shown diverse pharmacological activities.

Botanical Glossary

abaxial: away from the axis, referring to the surface of an organ that is furthest from the axis in bud

actinomorphic: having radially arranged floral segments which are more or less equal in size and shape

acuminate: tapering gradually to an extended point

acute: terminating in a distinct but not extended point, the converging edges forming an angle of less than 90 degrees

adaxial: towards the axis, referring to the surface of an organ that is closest to the axis in bud

alternate: borne singly and spaced around and along the axis, applied to leaves or other organs on an axis

annual: a plant/tree whose life cycle is only one year

articulated: consisting of segments held together by joints

axillary: situated at the angle between one part of a plant and another part, e.g., a branch and a leaf

basal: arising from or positioned at the base

bipinnate: 2-pinnate; twice pinnately divided

blade: part of the leaf above the sheath or petiole

bract: a leaf-like structure, usually different in form from the normal leaves, associated with the inflorescence

bulbous: shaped like a bulb; having an underground storage organ made up of enlarged and fleshy scales wrapped around each other from which flowers and leaves are produced

calyx: the outermost part of a flower, usually green

capsule: a dry fruit formed from two or more carpels that splits at maturity to release the seeds

carpel: the female reproductive organ of a flower
chartaceous: papery
compound: consisting of two or more anatomically or morphologically equivalent units
cordate: heart-shaped in outline
coriaceous: leathery
corolla: consists of petals or a corolla tube and corolla lobes
crenate: with obtuse or rounded teeth which either point forwards or are perpendicular to the margin
cuneate: obtangular, i.e., wedge-shaped
cylindrical: tubular- or rod-shaped
cyme: an inflorescence in which each flower, in turn, is formed at the tip of a growing axis, further flowers being formed on branches arising below. adj. cymose
decussate: having paired organs with successive pairs at right angles to give four rows
dehiscent: breaking open at maturity to release the contents
dentate: with sharp, spreading, rather coarse teeth standing out from the margin
denticulate: finely dentate
discoid: resembling a disc
drupe: a fleshy or pulpy fruit with the inner portion of the pericarp hard or stony
ellipsoid: elliptic in outline and with a length:breadth ratio between 3:2 and 2:1
elliptic: widest at the middle of the blade, with curved margins and pointed apex and base
elongate: lengthened; stretched out
endocarp: the innermost layer of the fruit wall, derived from the innermost layer of the carpel wall
endospermous: possessing the nutritive tissue of a seed, consisting of carbohydrates, proteins, and lipids
entire: without any incisions or teeth
epiphyte: a plant growing on, but not parasitic on, another plant. adj. epiphytic
erect: upright; perpendicular
evergreen: a plant/tree that has leaves all year round
exocarp: the outermost layer of the fruit wall, derived from the outermost layer of the carpel wall. Sometimes called epicarp
extipulate: leaves without stipules
filament: the stalk of a stamen below the point of attachment to the anther
-foliolate: used with a number prefix to denote the number of leaflets
follicle: a dry fruit, derived from a single carpel and dehiscing along one suture
frond: the leaf of a fern or cycad
fusiform: spindle-shaped, i.e., is circular in cross-section and tapering at both ends
glabrous: without hairs
glaucous: blue-green in colour, with a whitish bloom
globose: spherical or globular; circular in outline
herb: a plant which is non-woody or woody at the base only; some having medicinal properties
herbaceous: herb-like; often applied to bracts, bracteoles or floral parts that are green and soft in texture
hermaphrodite: self-pollinating plants containing both male and female reproductive organs, namely stamens and ovary respectively
imbricate: closely packed and overlapping
indehiscent: not opening or splitting to release the contents at maturity
inflorescence: the arrangement of flowers in relation to the axis and to each other
internode: the part of an axis between two successive nodes, joints or point of attachment of the leaves
introduced: not indigenous; not native to the area in which it now occurs
lanceolate: lance-shaped, much longer than wide, the widest point below the middle
leaflet: one segment of a compound leaf
leathery: possess the feel or texture of leather
linear: long and narrow, with essentially parallel margins
lobe: a usually rounded or pointed projecting part, usually one of two or more, each separated by a gap
margin: the edge of the leaf blade
mesocarp: the middle layer of the fruit wall derived from the middle layer of the carpel wall
mucilaginous: soft, moist, viscous and slimy
native: a plant indigenous to the locality
oblanceolate: reverse lanceolate, widest above the middle of the blade
oblong: rectangular, with nearly parallel margins, about two times as long as wide
obovate: reverse ovate, with the broadest part above
obtuse: blunt or rounded at the apex, the converging edges separated by an angle greater than 90 degrees
opposite: describing leaves or other organs which are at the same level but on opposite sides of the stem
ovate: broader part at the end of the base
ovoid: egg-shaped; ovate in outline
palmate: describing a leaf which is divided into several lobes
**panicle**: a compound raceme; an indeterminate inflorescence in which the flowers are borne on branches of the main axis or on further branches of these. adj. paniculate

**paripinnate**: pinnate with an even number of leaflets and without a terminal leaflet

**pedicel**: the stalk of an individual flower

**perennial**: with a life span extending over more than two growing seasons

**perianth**: the outer floral whorl or whorls of a monocotyledonous flower

**pericarp**: the wall of a fruit developed from the ovary wall. Composed of the exocarp, mesocarp and endocarp

**petal**: free segment of the corolla

**petiole**: the stalk of a leaf

**pinna**: a primary segment of the blade of a compound leaf or frond. pl. pinnae

**pinnate**: with the same arrangement as a feather

**plumule**: the primary bud of an embryo or germinating seed

**pod**: a dry dehiscent fruit containing many seeds

**prostrate**: lying flat on the ground

**raceme**: an unbranched flower spike where the flowers are borne on pedicels

**rachis**: the axis of a pinna in a bipinnate leaf

**receptacle**: the region at the end of a pedicel or on an axis which bears one or more flowers

**reniform**: kidney-shaped in outline

**rhizome**: a creeping stem, usually below ground, consisting of a series of nodes and internodes with adventitious roots

**rhombic**: diamond-shaped, widest at the middle and with straight margins

**rosette**: a tuft of leaves or other organs resembling the arrangement of petals in a rose
**serrate**: toothed so as to resemble a saw; with regular, asymmetric teeth pointing forward

**sessile**: without a stalk

**shrub**: a woody plant usually less than 5 m high and many-branched without a distinct main stem except at ground level

**simple**: not divided, e.g., applied to a leaf not divided into leaflets

**spathe**: a large bract ensheathing an inflorescence or its peduncle

**spike**: an unbranched inflorescence of sessile flowers or spikelets. adj. spicate

**stamen**: one of the male organs of a flower, consisting typically of a stalk ( filament) and a pollen-bearing portion ( anther)

**stellate**: star-shaped, usually referring to hairs with radiating branches

**stipe**: a stalk or support such as the petiole of a frond or the stalk of an ovary or fruit

**stipule**: one of a pair of leaf-like, scale-like or bristle-like structures inserted at the base or on the petiole of a leaf or phyllode. adj. stipulate

**stolon**: the creeping stem of a rosetted or tufted plant, giving rise to another plant at its tip

**strobilus**: a cone-like structure formed from sporophylls or sporangiophores. pl. strobili

**succulent**: fleshy, juicy, soft in texture and usually thickened

**tendril**: a slender organ formed from a modified stem, leaf or leaflet which, by coiling around objects, supports a climbing plant

**terminal**: at the apex or distal end

**tomentose**: covered with not very long cottony hairs

**trigonous**: obtusely 3-angled; triangular in cross-section with plane faces

**truncate**: with an abruptly transverse end as if cut off

**tuber**: a stem, usually underground, enlarged as a storage organ and with minute scale-like leaves and buds or “eyes”
umbel: an inflorescence in which the pedicels originate from one point on top of the peduncle and are usually of equal length
undulate: with an edge or edges wavy in a vertical plane
urceolate: urn-shaped
variegate: diverse in colour or marked with irregular patches of different colours
vein: the vascular tissue of the leaf
verrucose: warty
whorl: a ring-like arrangement of similar parts arising from a common point or node

Medical Glossary

abortifacient: inducing abortion
abscesses: areas with necrotic liquid or pus accumulation
aching: causing physical pain or distress
acne: a disorder of the skin caused by inflammation of the skin glands and hair follicles
acrodynia: a disease of infancy and early childhood marked by pain and swelling in, and pink coloration of, the fingers and toes and by listlessness, irritability, failure to thrive, profuse, perspiration, and sometimes scarlet coloration of the cheeks and tip of the nose
adenitis: inflammation of a gland
AIDS: Acquired Immune Deficiency Syndrome
albuminuria: presence of serum albumin (protein) in the urine
aldosteronism: hyperaldosteronism; an abnormality of electrolyte balance caused by excessive secretion of aldosterone
alexipharmic: medicine that is intended to counter the effects of poison; an antidote to poison or infection
alexiteric: protecting against infection, venom and poison
alopecia: hair loss; baldness; absence of hair from skin areas where it is normally present
amylase: an enzyme that catalyses the hydrolysis of starch into sugars
analgesic: an agent that reduces or eliminates pain
anaphylaxis: hypersensitivity resulting from sensitisation following prior contact with the causative agent
anasarca: generalised massive oedema
angiogenic: an agent that promotes the growth of new blood vessels from pre-existing vessels
anodyne: an agent that relieves pain
anorexia: lack or loss of appetite for food
anthelmintic: an agent that destroys or expels parasitic intestinal worms
anthrax: a serious disease caused by Bacillus anthracis, a bacterium that forms spores
antianaphylactic: an agent that prevents anaphylaxis (exaggerated reaction of an organism to which it has previously become sensitised)
antiangiogenic: preventing the growth of new blood vessels
antianxiety: allaying anxiety
antiapoptotic: preventing genetically programmed cell death
antiarrythmic: preventing or alleviating irregular heart beats
antiatherogenic: an agent that is capable of stopping the formation of fat deposits in blood vessels
antibacterial: an agent that destroys or stops the growth of bacteria
anticancer: reducing the frequency or rate of uncontrolled cell growth
anticarcinogenic: describing an agent that will stop the formation of a cancer
anticholinergic: opposing or blocking the physiological action of a neurotransmitter, acetylcholine, which contract muscles and causing excitatory actions in the central nervous system
anticoagulant: acting to prevent clotting of blood
anticonvulsant: an agent that prevents or relieves seizures or epileptic attack
antidepressant: an agent that stimulates the mood of a patient
antidiabetic: an agent that controls high blood sugar
antidiarrhoeal: substances used to prevent or treat diarrhoea
antidotal: counteracting the effects of a poison
antiemetic: an agent that prevents or alleviates nausea and vomiting
antifertility: agent that is capable of reducing or adversely affecting fertility
antifilarial: an agent that counters nematode (roundworm) of the superfamily Filarioidea

antifungal: an agent that destroys or inhibits the growth of fungi

antigenotoxic: an agent that is capable of preventing damage to DNA molecules in genes, causing mutations, tumours, etc.

antihyaluronidase: directed or effective against an enzyme (hyaluronidase) that breaks down hyaluronic acid, thus facilitating the spread of fluid through tissues

antihypertensive: an agent that controls high blood pressure

anti-inflammatory: an agent that counteracts inflammation

antileishmanial: directed or effective against leishmania, a parasitic protozoan that causes leishmaniasis

antimalarial: an agent that prevents or treat the disease malaria caused by the Plasmodium parasite

antimicrobial: destroying or inhibiting the growth of microorganisms

antimitotic: pertaining to certain substances capable of stopping cell division (mitosis)

antimutagenic: directed or effective against substances that tends to increase the frequency or extent of mutation

antineoplastic: inhibiting or preventing the growth and spread of neoplasms or cancerous cells

antinociceptive: relieving pain

antiosteoporotic: directed or effective against osteoporosis (characterised by decrease in bone mass with increased porosity and brittleness)

antioxidant: inhibiting oxidation or an agent that does so

antioxidative: protect body cells from the damaging effects of oxidation

antiplasmodial: directed or effective against the malarial parasites (Plasmodium species)

antiplatelet: inhibiting or stopping the formation of platelet aggregation

antiproliferative: inhibiting cell growth
antiprotozoal: tending to destroy or inhibit the growth of protozoans
antipruritic: preventing or relieving itching
antipsychotic: any of the powerful tranquilisers used especially to treat psychosis and believed to act by blocking dopamine nervous receptors
antipyretic: reducing fever or an agent that reduces fever
antirheumatic: relieving or preventing rheumatism
antischistosomal: directed or effective against infection caused by trematode worms (schistosomes) which are parasitic in the blood of humans and other mammals
antiseptic: any substance that inhibits the growth and reproduction of microorganisms
antispasmodic: an agent that prevents or relieves muscle spasms
antithyroidal: opposing thyroid function
antitrichomonal: directed or effective against some protozoa (Trichomonas)
antituberculosis: effective in the treatment of tuberculosis, a condition due to Mycobacterium tuberculosis
antitumour: inhibiting the growth of tumour cells
antitussive: effective against cough; an agent that suppresses coughing
antiulcer: prevent or cure ulcers or irritation of the gastrointestinal tract
antulcerogenic: directed or effective against development of ulcers
antivenom: an agent used in the treatment of poisoning by animal toxins
antiviral: acting, effective, or directed against viruses
anuria: lack of urine production
anxiolytic: relieving anxiety or an agent that relieves anxiety
aperient: a mild laxative or gentle purgative
aphrodisiac: an agent that stimulates sexual desire
apnoea: a condition whereby breathing is stopped
apoptotic: a term used to describe the state of programmed cell death
appendicitis: inflammation of the appendix
arrhythmia: abnormal heart beat
arthritis: inflammation of joints
ascites: effusion and accumulation of fluid in the abdominal cavity
asthma: a chronic, inflammatory lung disease characterised by recurrent breathing problems usually triggered by allergens
astringent: having the property of causing contraction of soft organic tissues for the control of bleeding or secretions
atherosclerosis: thickening, hardening and loss of elasticity of the walls of arteries
athlete's foot: fungal infections on the feet, often smelly
atrophy: a wasting away; reduction in the size of a cell, tissue or organ
bacillary: pertaining to the bacteria bacilli or to rod-like structures
bechic: pertaining to cough
beriberi: a disease due to vitamin B1 deficiency, marked by inflammation of nerves, heart problems and oedema
bilious: relating to or containing bile
blennorrhoea: any free discharge of mucus, especially from urethra or vagina
blisters: a vesicle
boils: furuncle; tender, swollen areas of infection that usually form around hair follicles
bronchial: pertaining to or affecting one or both windpipe
bronchiolitis obliterans: a disease of the lungs where the bronchioles are inflamed and plugged with granulation tissue
bronchitis: inflammation of mucous membrane of the windpipe (bronchus)
cachexia: general ill health and malnutrition
calculus: abnormal hard deposit, usually composed of mineral salts, occurring within the body
cancer: a malignant tumour of growth that expands locally by invasion and systemically by metastasis

carbuncles: swollen lumps or masses under the skin due to skin infections that often involve a group of hair follicles

cardiac: pertaining to the heart

cardioprotective: protecting the heart function

cardiotoxic: an agent that increases tonicity of the heart muscles

carminative: an agent that relieves and removes gas from the digestive system

cataracts: conditions in which there is a loss or reduction of transparency of the lens of the eye causing progressive loss of clarity and detail of images

catarrh: a condition of the mucous membranes characterised by inflammation and mucous

cathartic: an active purgative, producing bowel movements and evacuation of the bowels

cephalgia: headache

chemopreventive: a chemical agent that can help prevent the development of cancer

chilblains: inflammation or blister of the hands and feet caused by exposure to cold or moisture

cholera: a form of intestinal infection that results in frequent watery stools, cramping abdominal pain and eventual collapse from dehydration

Cicatrizant: a medicine or application that promotes the healing of a sore or wound, or the formation of a cicatrix, which is a scar left by the formation of new connective tissue over a healing sore or wound

coagulant: an agent promoting clotting of blood

cold sore: a recurrent, small blister in and around the mouth caused by the herpes simplex virus

colic: acute paraxysmal abdominal pain or pertaining to the colon
coma: a state of profound unconsciousness from which the patient cannot be aroused, even by powerful stimuli

condiment: something used to give a special flavour to food, as mustard, ketchup, salt, or spices

congestive heart failure: the heart fails to pump efficiently, resulting in swelling, shortness of breath, weakness, etc.

conjunctivitis: inflammation of the conjunctiva, generally associated with discharge

constipation: infrequent or difficult evacuation of faeces

contraceptive: an agent capable of preventing the formation of a foetus

contusion: injury to a part without a break in the skin; a bruise

convulsions: spasms, epilepsy

coolant: an agent that produces cooling

coryza: profuse discharge from the mucous membrane of the nose

counter-irritant: an agent producing counter-irritation, so that less pain at a particular site is experienced

cramps: a painful spasmodic muscular contraction

Crohn’s disease: a chronic inflammatory disease of the digestive tract, particularly the small intestine and colon

cystitis: inflammation of the urinary bladder

cytotoxic: toxic to cells, preventing their reproduction or growth

dehydration: depletion of body fluids

delirium: mental state characterised by reduced ability to maintain attention to external stimuli and disorganised thinking

demulcent: an agent that soothes and protects the part to which it is applied

deoobstruent: removes obstructions by ducts or pores of the body

depressant: an agent that diminishes any functional activity

depurative: purifying the blood or the humours
dermatitis: inflammation of the skin

dermatosis: any skin disease, especially one not characterised by inflammation

diabetes: metabolic disorder resulting in high blood sugar and discharge of large amounts of sugar in the urine.

diaphoretic: an agent that increases perspiration

diarrhoea: abnormally frequent discharge of watery stools

digitalis: the dried leaf of Digitalis purpurea; used as a tonic for the heart

dipsia: thirst

discutient: an agent that causes the dispersal or causes something, such as a tumour or any pathologic accumulation, to disappear

diuretic: an agent that increases the production of urine

dropsy: an abnormal accumulation of serous fluid in cellular tissues or in a body cavity

dysentery: infection of the gut caused by a bacterium called shigella, characterised by abdominal pain, diarrhoea with passage of mucus or blood

dysmenorrhoea: difficult and painful menstruation

dyspepsia: indigestion

dyspnoea: difficult or laboured breathing

dysrhythmias: an abnormality in an otherwise normal rhythmic pattern

dysuria: painful or difficult urination

echymoses: small haemorrhagic spots in the skin or mucous membrane, forming a non-elevated, rounded or irregular, blue or purplish patch

eczema: an inflammatory condition of the skin characterised by redness, itching, scales, crusts or scabs alone or in combination

elephantiasis: a disease caused by tumours in lymph node or filarial worms, causing excessive swelling in limbs and genitalis

embrocations: alcohol-based treatments rubbed into the skin to relieve pain or which produce reddening of the skin

embryotoxicity: any toxicity that affects an embryo
emetic: an agent that induces vomiting
emmenagogue: a substance that promotes or assists the flow of menstrual fluid
emollient: an agent that will soften, soothe and protect the part when applied locally
enteritis: inflammation of the intestine, especially the small intestine
epigastric: pertaining to the upper and middle region of the abdomen
epilepsy: convulsions
epistaxis: nosebleed
eruptions: lesions on the skin that are usually red, raised, and easily visible
erysipelas: is an acute streptococcus bacterial infection marked by deep red inflammation of the skin and mucous membranes. This disease is also known as Saint Anthony’s fire
erythema: redness of the skin due to congestion of the capillaries
excrescences: abnormal outgrowth; a projection of morbid origin
expectorant: an agent that promotes the discharge or expulsion of mucus from the respiratory tract
febrifuge: an agent that reduces fever
fertility: the capacity to conceive or induce conception
fibroids: non-cancerous tumours made of muscle cells and tissues that grow in and around the wall of the uterus or womb
fibrosis: an abnormal formation of fibrous tissue as a reparative or reactive process, as opposed to the formation of fibrous tissue that is a normal constituent of an organ or tissue
filaricidal: an agent that kills filariae, nematodes that as adults are parasites in the blood or tissues of mammals and as larvae usually develop in biting insects
fistulae: abnormal connections between an organ, vessel or intestine and another structure, usually due to injury, surgery or result from infection or inflammation
flatulence: the presence of excessive gas in the intestinal tract, causing discomfort
fluxes: excessive flow or discharge
furuncle: infection of a hair follicle
furunculosis: the persistent sequential occurrence of furuncles over a period of weeks or months or the simultaneous occurrence of a number of furuncles
galactophoritis: inflammation of the milk ducts
galactorrhoea: excessive or spontaneous milk flow; persistent secretion of milk irrespective of nursing
gangrenous: characterised by the decay of body tissues, which become black and smelly
gastritis: inflammation of the stomach
gastroenteritis: inflammation of the lining membrane of the stomach and the intestinal tract
gastroprotective: protect the stomach
gavage: forced feeding, especially through a tube passed into the stomach
genotoxic: a toxic agent that damages DNA molecules in genes, causing mutations, tumours, etc.
glottal: pertaining to the vocal apparatus of the larynx, consisting of the true vocal cords and the opening between them
-glucosidase: an enzyme of the hydrolase class that breaks down a glucoside
gonorrhoea: infectious sexual disease due to Neisseria gonorrhoeae
gout: a metabolic disease that is a form of acute arthritis, marked by inflammation of the joints and great pain
-gravel: calculi occurring in small particles
haemaglutination: agglutination of red blood cells
haematemesis: the vomiting of blood
haematometra: an accumulation of blood in the uterus
haematuria: the finding of blood in the urine
haemiplegia: paralysis of one side of the body
haemolytic: lysis of red blood cells liberating haemoglobin in the plasma
haemoptysis: coughing up of blood from the airways
haemorrhage: profuse bleeding from the blood vessels
haemorrhoids: piles
haemostatic: stop bleeding
heartburn: painful, burning feeling in the chest caused by stomach acid flowing back into the esophagus
hepatitis: inflammation of the liver, usually due to viruses or toxins
hepatoprotective: protecting the liver functions
hepatotoxic: an agent that is toxic to liver cells
herpes: inflammation of the skin or mucous membrane with clusters of deep seated vesicles; a family of viruses that infect humans: herpes simplex causes lip and genital sores; herpes zoster causes shingles
hiccups: sharp inspiratory sound with spasm of the glottis and diaphragm
HIV: Human Immunodeficiency Virus, the virus that causes AIDS
hydragogue: producing watery discharge, especially from the bowels or a cathartic that causes watery purgation
hydrocele: swelling of and fluid on the testicles
hydrothorax: a collection of serous fluid within the pleural cavity
hypercholesterolaemic: high level of cholesterol in the blood
hyperemesis: excessive vomiting
hyperkalemia: high concentration of potassium in the blood
hypertension: high blood pressure
hypocholesterolaemic: an abnormal deficiency of cholesterol in the blood
hypoglycaemic: producing a decrease in the blood sugar level
hypolipidaemic: producing or resulting from a decrease in the level of lipids in the blood
hypotension: low blood pressure
hypotensive: marked by low blood pressure
immunoglobulin: a protein of animal origin with known antibody activity
immunomodulatory: having the ability to modify the immune response or function of the immune system
immunostimulatory: the ability to stimulate the immune response
immunosuppressive: being able to reduce the immune response
impetigo: a highly contagious skin infection caused by bacteria, usually occurring around the nose and mouth; commonly occurring in children
infertility: diminution or absence of ability to produce offspring
inflammation: localised protective reaction of tissue to irritation, injury, infection, chemicals, electricity, heat, cold or microorganisms. Characterised by pain, redness, swelling and possible loss of function
influenza: the flu; an infectious viral respiratory disease characterised by chills, fever, prostration, headache, muscle aches, sore throat, and a dry cough
inotropic: affecting the force or energy of muscular contractions
insanity: a legal term for mental illness, roughly equivalent to psychosis and implying inability to be responsible for one’s acts
insomnia: inability to sleep
intoxication: poisoning
jaundice: yellowish discoloration of the whites of the eyes, skin and mucous membranes caused by deposition of bile salts in these tissues
keratitis: inflammation of the cornea
lactogogue: a substance which stimulates the flow of milk
lamesness: a state of being incapable of normal locomotion
larvicidal: larvae killing (especially of parasites)
laryngitis: inflammation of the lining of the larynx causing hoarseness
**laxative**: having a tendency to loosen or relax, specifically in relieving constipation or an agent that relieves constipation

**leishmaniasis**: infection with Leishmania, a parasitic protozoa

**leprosy**: a chronic mycobacterial disease caused by *Mycobacterium leprae*, characterised by skin lesions and necrosis

**lethargy**: a condition of indifference or drowsiness

**leucoderma**: partial or total loss of skin pigmentation, often occurring in patches. Also called vitiligo

**leucodermic**: an agent that can cause partial or total loss of skin pigmentation, often occurring in patches. Also called vitiligo

**leucorrhoea**: a gynecologic disorder resulting in abnormal, thick, whitish, non-bloody discharge from the genital tract (uterus of vagina)

**leukemia**: a progressive, malignant disease of the blood-forming organs, marked by distorted proliferation and development of leukocytes and their precursors in the blood and bone marrow

**lipolytic**: an agent that breaks down fats

**lumbago**: pain in the lumbar or loin region

**lymphadenopathy**: enlargement of lymph nodes usually associated with inflammation or infection

**malaria**: a febrile disease caused by infection with Plasmodial parasites, causing periodic attacks of chills, fever and sweating

**mange**: a skin disease of domestic animals or pets due to mites

**mastitis**: inflammation of the breast

**measles**: acute highly infectious viral human disease caused by a virus, specifically a paramyxovirus of the genus *Morbillivirus*, characterised by cough, fever, small red lesions each with whitish centre, formed in the mouth in early stages of the measles

**melancholic**: a depressed and unhappy emotional state with abnormal inhibition of mental and bodily activity

**menorrhagia**: excessive or prolonged menstruation
metritis: inflammation of the uterus
metrorrhagia: uterine bleeding; usually abnormal amount, occurring at completely irregular intervals, the period of flow sometimes being prolonged
molluscicidal: effective for destroying molluscs
mumps: infectious disease caused by a paramyxovirus, marked by fever and inflammation of parotid gland and swelling of the neck and throat
mydriasis: pupil dilation
myocardial: referring to the middle and the thickest layer of the heart wall, composed of cardiac muscles
narcotic: a drug or agent which in moderate doses depresses the central nervous system, relieving pain and producing sleep but in large doses, produces unconsciousness, stupor, coma and possibly death
nausea: an unpleasant sensation vaguely referred to the epigastrium and abdomen, with a tendency to vomit
necrosis: the morphological changes indicative of cell death
neonatal: pertaining to the first four weeks after birth
nephritis: inflammation of the kidneys
nephropathy: disease of the kidneys
nephroprotective: an agent that protects or prevents damage to the kidney cells
nephrotoxic: toxic to kidney cells
neuralgia: pain occurring in the area served by a sensory nerve
neurasthenia: nervous debility dependent upon impairment in the functions of the spinal cord
neurodermatitis: a general term for a dermatosis presumed to be caused by itching due to emotional causes
neuroleptics: effects on cognition and behavior of antipsychotic drugs, which produce a state of apathy, lack of initiative and limited range of emotion
**neuroprotective**: an agent that protects or prevents damage to the nerves

**neurotoxic**: toxic to the nerves or nervous tissue

**neurotoxicity**: the quality of exerting a destructive or poisonous effect on nerves

**nits**: the eggs or youngs of a parasitic insect, such as a lice

**nodal rhythm**: a type of heart rhythm disorder; the cardiac rhythm that results when the heart is controlled by the atroventricular node in which the impulse arises in the atroventricular node, ascends to the atria, and descends to the ventricles more or less simultaneously

**non-teratogenic**: referring to substance which will not cause malformations of an embryo or fetus

**oedema**: the presence of abnormally large amounts of fluid in the intercellular tissue spaces of the body

**oesophagitis**: inflammation of the esophagus

**oliguria**: diminished urine secretion in relation to fluid intake

**ophthalmia**: severe inflammation of the eye

**osteoclasis**: surgical fracture or refracture of bones

**osteodynia**: ostealgia; pain in the bones

**otitis**: inflammation of the ear

**oxytocic**: an agent that promotes rapid labour by stimulating contractions of the uterus

**oxyuriasis**: infection with Enterobius vermicularis (in humans) or with other worms

**pacemaker**: a device that regulates the rhythm of the heart beat

**palsy**: paralysis

**panacea**: a remedy for all diseases

**parasiticidal**: destructive to the parasites

**parturition**: the act or process of giving birth to a child

**periodontitis**: inflammation of the tissues surrounding and supporting the teeth
pertussis: whooping cough
pharyngitis: inflammation of the pharynx (throat)
photoprotective: protecting against harmful effects of lights (UV-irradiation)
phototoxicity: toxic effect triggered by exposure to light
piles: haemorrhoids
piscicidal: a substance that kills fish
pleurisy: inflammation of the serous membrane investing the lungs and lining the walls of the thoracic cavity
pneumonia: inflammation of the lungs due to a bacterial or viral infection, which causes fever, shortness of breath, and the coughing up of phlegm
pollakiuria: abnormally frequent urination
postpartum: occurring after childbirth, with reference to the mother
prolapse: the falling down, or downward displacement, of a part or viscus
prophylactic: an agent that prevents or protects against a disease or condition
prurigo: any of several itchy skin eruptions in which the characteristic lesion is dome-shaped with a small transient vesicle on top, followed by crusting or lichenification
psoriasis: a chronic skin disease characterised by inflammation of the skin and formation of red patches
puerperal: pertaining to a woman who has just given birth to a child or to the period or state of confinement after childbirth
purgative: an agent that will cause evacuation of the intestinal contents
pustule: a small, circumscribed elevation of the skin containing pus
radioprotective: serving to protect or aiding in protecting against the harmful effects of radiation
rectocele: hernial protrusion of part of the rectum into the vagina
refrigerant: an agent that produces coolness or reduces fever, allays thirst and gives a sensation of coolness to the system.
resolvent: promoting resolution or the dissipation of a pathologic growth
retching: strong involuntary effort to vomit

Reye's syndrome: a rare disorder in children and teenagers while recovering from childhood infections, such as chicken pox, flu, and other viral infections. Reye's syndrome include nausea, severe vomiting, fever, lethargy, stupor, restlessness, and possibly delirium. Also caused by taking aspirin in children less than 16 years old

rheumatism: general term for acute and chronic conditions characterised by inflammation (arthritis, tendonitis and bursitis), soreness and stiffness of muscles, and pain in joints

rhinitis: inflammation of the nasal mucous membrane

ringworm: any of a number of contagious skin diseases caused by certain parasitic fungi and characterised by the formation of ring-shaped eruptive patches

rubefacient: an agent that produces a mild irritation, reddening of the skin, and local vasodilation increasing the blood supply to the area of application.

saluretics: agents that promotes urinary excretion of sodium and chloride ions

scabies: a contagious skin disease characterised by itching, inflammation, hair loss and secondary bacterial infection.

schistosomiasis: infection with Schistosoma (blood flukes) which causes infection in man by penetrating the skin of people coming in contact with infected waters

sclerosis: an induration or hardening, especially from inflammation and in diseases of the interstitial tissues

scrofula: primary tuberculosis of the cervical lymph nodes; the inflamed structures being subject to a cheesy degeneration

scurvy: disease characterised by spongy bleeding gums, loosening of teeth, and mucous membranes that is caused by lack of Vitamin C

sedative: tending to calm, moderate, or tranquilise nervousness or excitement or an agent that does so

senility: the physical and mental deterioration associated with old age

septicaemia: blood poisoning
sialogogue: an agent that stimulates the flow of saliva
sinus bradycardia: a normal but slow heart rhythm
sinusitis: inflammation of a sinus
smallpox: an acute infectious disease due to poxvirus, marked by sustained high fever and the appearance of skin eruptions and pustules, leaving small, depressed, depigmented scars
sores: any lesion of the skin or mucous membranes
spasm: a sudden, violent, involuntary muscular contraction
spastic paraparesis: partial paralysis of the lower extremities due to muscular stiffness and spasms
spermatogenesis: formation and development of sperms
spermatorrhoea: involuntary escape of semen, without orgasm
spermatotoxic: an agent that is toxic to spermatozoa
splenitis: inflammation of the spleen
splenosis: Implantation and subsequent growth of splenic tissue within the abdomen as a result of disruption of the spleen
sprue: a chronic form of malabsorption syndrome
stammering: a disorder of speech behaviour marked by involuntary pauses in speech
stasis: stoppage of flow, as of blood or other body fluid
stimulant: an agent that excites the functional activity of an organ or system
stomachic: an agent that stimulates the appetite and gastric secretion
strabismus: squint
sty: a circumscribed abscess caused by bacterial infection of the glands on the edge of the eyelid
styptic: astringent or arresting haemorrhage by means of an astringent quality
sudorific: an agent that promotes sweating; diaphoretic
sunstroke: a condition caused by excessive exposure to the sun, marked by high skin temperature, convulsions and coma
**suppository**: an easily fusible medicated mass to be introduced into a body orifice

**syphilis**: a contagious sexual disease caused by Treponema pallidum, characterised by local formation of ulcerous skin eruptions and systemic infection

**tachycardia**: increased heart beat

**tachypnea**: very rapid respiration

**taeniasis**: infection with tapeworms

**taenifuge**: an agent that expels tapeworms

**teratogenic**: an agent that causes physical defects in the developing embryo

**tetanus**: an acute, sometimes fatal, disease of the central nervous system; caused by the toxin of the tetanus bacterium

**thrush**: candidiasis of the oral mucous membranes, fungal infection by Candida albicans with formation of whitish spots

**tonic**: producing and restoring normal tone or characterised by continuous tension

**tonsillitis**: inflammation of the tonsils

**trachoma**: a contagious disease of the conjunctiva and cornea, producing photophobia, pain, and lacrimation, caused by Chlamydia trachomatis

**tuberculosis**: any of the infectious diseases of man and other animals due to species of Mycobacterium and marked by formation of tubercles and caseous necrosis in tissues of any organs, usually the lung

**tumour**: an abnormal growth of tissue resulting from uncontrolled multiplication of cells and serving no physiological function

**tympanites**: abnormal distention due to the presence of gas or air in the intestine or the peritoneal cavity

**typhoid**: acute infectious disease caused by Salmonella typhi and characterised by fever, severe physical and mental depression, diarrhoea and headache

**tyrosinase**: an oxidising enzyme, occurring in plant and animal tissues, that catalyses the aerobic oxidation of tyrosine into melanin and other pigments
ulcerative colitis: a chronic inflammatory disease of the colon or colon and rectum, characterised by abdominal pain and diarrhoea, often mixed with blood and mucus

urinary calcification: the deposit of calcium salts in the tissues of the urinary tract

urinary lithiasis: the formation of urinary stones

urodynia: pain in urination

urticaria: an allergic disorder marked by raised patches of skin causing itchy swellings of the skin

uteral: relating to uterus

uterine haemorrhage: bleeding in the uterus

uterotonic: increasing the tone of uterine muscle

vaginismus: painful spasm of the vagina, hence often resulting in unsuccessful penetration

varices: enlarged tortuous vein, artery or lymphatic vessel. adj. varicose

vasodilation: dilation of blood vessels

vasorelaxant: an agent that relaxes the blood vessels

venereal: due to or propagated by sexual intercourse

vermifuge: an agent that causes the expulsion of intestinal worms

verruca: a wart or one of the wart-like elevations on the endocardium in various types of endocarditis

virility: the condition or quality of being virile

vitiligo: a condition in which destruction of melanocytes in small or large circumscribed areas results in patches of depigmentation often having a hyperpigmented border, and often enlarging slowly

vulnerary: a remedy useful in healing wounds

wandering pacemaker: an atrial arrhythmia that occurs when the natural cardiac pacemaker site shifts between the sino-atrial node, the atria and/or the atrioventricular node
warts: abnormal growths on the skin due to viral infection caused by human papillomavirus

whitlow: an infection of the fingers caused by herpes simplex virus

whooping cough: a bacterial infection especially of the children caused by bacterium Bordetella pertussis marked by convulsive spasmodic coughs
